cothe human CCAAT/enhancer-binding protein alpha (C/BBP alpha) gene, which human CCAAT/enhancer-binding protein alpha (C/BBP alpha) gene, which inhibit it lits expression. The antisease oligonucleotides were designed to target different regions of the human C/BBP alpha RNA, and were analysed for their effect on C/BBP alpha mRNA levels by quantitative captelled for their effect on C/BBP alpha mRNA levels by quantitative captelled of hybridising to mouse C/BBP alpha mRNA. The C/BBP family of proteins are a family of transcription factors which regulate the expression of wide range of genes that control normal tissue development, callular function, of genes that control normal tissue development, callular function, and service and chones feration and functional differentiation.

C/BBP alpha (also known as CBBPA) is primarily found in tissues involved in energy metabolism which have a capacity to metabolise involved in collecter activity, in the hormonal regulation of adjocyte and chondrogenic differentation, and is also involved in follicular development and ovulation, steroid-induced cell cycle arrest in the liver, in controlling glucose transporter GUTZ promoter activity, in the hormonal regulation of metabolism, and in cycle arrest in the liver, in controlling clucose transporter GUTZ promoter activity, in the hormonal regulation of metabolism, and in cycle arrest promoter activity, and the diagnosis, prevention and treatment of conditions associated with control of conditions associated with control of conditions associated with control of conditions are useful controlled to the conditions of conditions or controlled cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       colon, luny

The invention relates to an isolated 98P7C3-related protein which is a homeodomain protein highly expressed in various cancers. Also include are homeodomain protein highly expressed in various cancers. Also include are polymucleotides encoding the protein or proteins 90% identical to 98P7C3, a pharmaceutical composition comprising the polymucleotides (including an expression vector comprising the 98P7C3 encoding polymucleotides) or a comparation or polymucleotides in a biological ample, monitoring the 98P7C3 protein or polymucleotides in a biological sample, monitoring the 98P7C3 protein or polymucleotides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3 protein, or T cell/B cell composition or polymucleotides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3. protein, or T cell/B cell composition in immunogens derived from it, are useful in inducing an immune response (in mammal) to a 98P7C3 protein. Upon contact with a cytotoxic T cell/B cell composition or epitope. The antibody is useful for delivering a cytotoxic agent to the antibody or its fragment that specifically binds cytotoxic agent to the antibody or its fragment that specifically binds conjugate. The modulator is useful for treating a patient with a cancer that expresses 98P7C3. by conjugation with a cancer, conjugate. The modulator is useful for treating a patient with a cancer conjugate. The modulator is useful for treating a patient with a cancer conjugate. The modulator such that the vector conjugate the modulator, such that the vector cells and exposing the method of suppression subtractive colls and the anced of an antibody coding sequence to the cancer cells and the encoded single chain antibody coding sequence to the cancer cells and the encoded single chain antibody coding sequence to the cancer cells and the encoded single chain antibody especies of that expresses of intracer and colon cancer), by administering the coll of an actual colon cancer of a cubh sequence for 98P7C3 by the method o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAS95810-AAS95820 represent the 103P3E8 gene and the primers and adaptors used to amplify 103P3E8 DNA. 103P3E8 exhibits tissue and adaptors used to amplify 103P3E8 DNA. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 bladder, comprising a polymucleotide protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P3E8 related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can be used in diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                        Monitoring 103P3E8 gene products in sample from patient (suspected of) having cancer, useful for diagnosing, managing or treating cancers, e.g. prostate cancer, comprises determining presence of aberrant 103P3E8 gene

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant correlating the clones having said marker sequence; (d) the multiwell copies containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. or array the multiwell copies; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell copies; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell completes; (e) the mixed clones are cultured and the call lateral directions; (f) the mixed clones are cultured and the creatitate cultures are amplified by using the above primer; (g) signals creatituted as the positions on the chromosome and arrayed. The clones are reconstituted as the positions on the chromosome and arrayed. The mixed plates are sepecified from the malysis. ABM45323 to ABM45324 represent propresent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention Sequence 20 BP; 5 A; 8 C; 3 G; 4 T; 0 U; 0 Other;

(ISIS-) ISIS PHARM INC.

Novel antisense compound useful for treating type 2 diabetes, cancer and obssity, is targeted to nucleic acid encoding human protein phosphatase 18, and hybridizes and inhibits PTP18 expression. Cowsert LM, Wyatt J, Freier SM, Monia BP, Butler MM, Mckay R; WPI; 2002-180079/23.

Example 15; Page 67; 142pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding procein phosphatase 1B (PTP1B), which specifically hybridises with and inhibite the expression of PTP1B. The compounds of the invention are useful for inhibiting the expression of PTP1B in liver, kidney or adipose cells or tissues and for treating an animal, preferably human, having a disease or conditions associated with PTP1B, including metabolic hyperproliferative conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of a disease or condition associated with PTP1B, and for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTP1B mRNA level inhibition antisense oligonucleotide of the invention

The invention relates to a compound targeted to a nucleic acid molecule encoding protein phosphatase 1B (PTP1B), which specifically hybridises with and inhibits the expression of PTP1B. The compounds of the invention are useful for inhibiting the expression of PTP1B in liver, kidney or adjoce cells or tissues and for treating a naimal, preferably human, having a disease or condition associated with PTP1B, including metabolic diseases or conditions, e.g. type 2 diabetes and obesity, or hyperproliferative conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTP1B mRNA level inhibition antisense oligonucleotide of the invention

Novel antisense compound useful for treating type 2 diabetes, cancer and obesity, is targeted to nucleic acid encoding human protein phosphatase 1B, and hybridizes and inhibits PTPIB expression.

Example 16; Page 72; 142pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding protein phosphatase 1B (PTP1B), which specifically hybridises with and inhibits the expression of PTP1B. The compounds of the invention are useful for inhibiting the expression of PTP1B in liver, kidney or adipose cells or tissues and for treating an animal, preferably human, having a disease or condition associated with PTP1B, including metabolic

diseases or conditions, e.g. type 2 diabetes and obesity, or hyperproliferative conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of a disease or condition associated with PTHB, and for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTPIB mRNA level inhibition antisense oligonucleotide of the invention 8888888888

Detecting the presence of Mycobacterium tuberculosis in a test sample, comprises inducing mRNA expression of Mycobacterium tuberculosis and detecting the induced mENA.

Claim 8; Page 14; 70pp; English.

The invention comprises a method for detecting the presence of a microorganism (particularly Mycobacterium tuberculosis) in a test sample. The method of the invention comprises exposing the test sample to an inducer that is capable of inducing the expression of at least one gene in the micro-organism and then testing for the presence of mRNA from this gene. The method of the invention is useful for detecting an mRNA that is tuberculosis). The present DNA sequence represents a Mycobacterium tuberculosis). The present DNA sequence represents a Mycobacterium specific nucleotide which can be used as a primer or probe in the method the invention

The invention discloses an adenoviral vector for the selective expression of a toxin gene in a cancer cell. The toxin gene is operably linked to a promoduce of a gene with undetectable expression in liver, so that promoduce of a gene with undetectable expression in liver, so that expression of the toxin gene is reduced in liver cells. Adenoviral vectors and adenoviral gene therapy have been used to introduce suicide/toxic genes to advanced gastrointestinal or pencreatic cancer cells. This technique has a problem due to the hepatotropism of the adenovirus for systemically administered adenoviral vectors localise corringally to the liver, where the suicide gene therapy of intrahapatic tumour leads to severe liver dysfunction. Cyclooxygenses-2 (Cox-2) has virtually undetectable expression in most tissues, but is closely linked to carcinogenesis and progression of colon cancers. The promoter of Cox-2 therefore has a tumour "on" liver "off" expression profile, which can be utilised in the adenoviral gene therapy vectors. The adenovirus is used to illised in the adenovirus gene therapy particularly concerted to suplify glyceraldehyde-3-concerted to amplify gly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 An adenoviral vector containing a toxin gene under control of a promoter with undetectable expression in the liver is useful to treat gastrointestinal or pancreatic cancer with reduced liver toxicity.

Novel antisense compound targeted to nucleic acid molecule encoding the BH3 interacting domain death agonist, useful for treating animals with diseases associated with BH3 interacting domain death agonist, e.g. hepatitis.

Claim 3; Page 87; 171pp; English.

The invention relates to a compound 8 to 50 nucleotides in length
targeted to a nucleic acid molecule encoding a BH3 interacting domain
death agonist, where the compound specifically hybridses with and
inhibits the expression of the BH3 interacting domain death agonist. The
compound of the invention is useful for inhibiting the expression of the
BH3 interacting domain death agonist in cells or tissues. The compound is
also useful for treating an animal having a disease or condition
associated with the BH3 interacting domain death agonist, e.g.
haematopoietic disorder, hyperproliferative disorder, a developmental
disorder, immunological disorder, or a disease or condition of the liver
c e.g., hepatitis, or a condition associated with apoptosis. The compound
is useful for diagnostics, therapeutics, proph/laxis and as research
c reagents and kits. This polynucleotide sequence represents an antisense
c oligonucleotide inhibitor of the DNA from human BH3 interacting domain
death agonist RNA of the invention. NOTE: This sequence is a chimeric
c oligonucleotide 20 nucleotides in length, which is flanked on both sides
by five-nucleotides. The wings are composed of 2'-methoxyethyl (2'
"NOE) nucleotides. The internucleoside (backbone) linkages are
c phosphorothoate (P=S) throughout the oligonucleotide. (Updated on 29-AUG

Butler MM, Wyatt J; Monia BP,

WPI; 2002-214451/27.

Novel antisense compound targeted to nucleic acids encoding human or mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for inhibiting expression of human or mouse C/EBP beta in cells/tissues.

Claim 1; Col 42; 69pp; English.

Sequences AB194252-AB194476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BBP alpha) and which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/BBP alpha RNA, and were analysed for their effect on C/BBP alpha mRNA levels of granditation factors which regulate the expression of a wide range of transcription factors which regulate the expression of a wide range of conditions and functional differentiation. C/BBP beta (also Known as C/BBB2, LAP, TCF5, CRP2, NFILG, ILGOBP, NFW, AGP/BBP and Apc/BBP) conditions and functional differentiation. C/BBP beta (also Known as C/BBB2, LAP, TCF5, CRP2, NFILG, ILGOBP, NFW, AGP/BBP and Apc/BBP) conditions a mediator of IL-6 (interleukin-6) signalling. C/BBP beta is thought to be involved in carbobydate metabolism, immunity, the Th1 cresponse, female fertility and gluconeogenic pathways. C/BBP beta is compared in malignant ovarian tissue compared with normal ovarian tissue. Conditions and testais, with the conditions and itsue compared with normal ovarian tissue. Conditions associated with C/BBP beta as indicating that it is involved in the conditions are useful for diagnosis, prevention and treatment of impairment of insulin secretion in type II diabetes. The oligonucleotides conditions associated with C/BBP beta expression, guch as cancer conditions associated with C/BBP beta expression, guch as cancer conditions undertes), infection, or inflammation.

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological eample from a parient who has or is suspected of having cancer cancer), computed (a) determining the status of 83P2H3 gene products expressed by calls in a tissue sample from an individual and (b) comparing the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 function or status, generating antibodies/immune response against 83P2H3 conjugating the agent to an entigen) binding peptides derived from the protein delivering a cytotoxic agent to a cell cypridma that produces the recombinant protein, a non-human transgenic animal that produces the recombinant protein, a non-human transgenic animal that produces the recombinant protein, a non-human of the anti-83P2H3 antibody, a vector comprising a non-human of the anti-83P2H3 antibody, a vector comprising a non-human soft the anti-83P2H3 antibody, a vector comprising a non-human system T cell or B cell epitope, and contacting the protein that comprises a T cell or B cell respectively. The method is useful for monitoring the presence of cancer in an individual. The modulator is cancer that expresses 83P2H3. The immunological methods are useful for cancer that expresses 83P2H3. The immunological methods are useful for Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample. Example 1, Page 76; 201pp; English.

The invention relates to a composition comprising a substance that
modulate the status of 85PBB3, where the status of a cell expresses
85PBB3 gene product is modulated. Also included are a composition
comprising a peptide region of 5 amino acids of the 85PBB3 protein, in
any whole number increment up to 229 that includes an aa position
selected from an aa position having a value greater than 0.5 in the precent accessible residue profile, an aa position having a value greater than
0.5 in the percent accessible residue profile, an aa position having a value greater than
0.5 in the average flexibility profile; a an aa position having a value greater than
0.5 in the average flexibility profile; a position having a value greater than 0.5 in the average flexibility profile; a position having a value greater than 0.5 in the beta-turn profile; a polymucleotide that encodes analogue peptide of 8, 9, 10 or 11 contiguous residues of the 85PBB3 protein; a recombinant protein comprising the antigen-binding region of a monocloral antibody; a non-human transgenic animal that produces an antibody that binds to the 85PBB3 protein; a

hybridoma that produces antibody specific to the protein; a single chain monoclonal antibody specific to the variable domains of the heavy and monoclonal antibodies specific to the protein; a vector comprising a polymucleotide that econes the MAD; inhibiting growth of cancer cells or treating a patient who bears cancer cells that expresses the protein, antibody, polymucleotide cancer cells that expresses ribozyme that cleaves the polymucleotide to the polymucleotide or ribozyme that cleaves the polymucleotide and T cells that specifically risozyme that cleaves the polymucleotide and T cells that specifically directed to the protein and generating a mammalian immune system to an immunogenic portion of the protein or polymucleotide. The composition, which comprises an antibody specific to the protein, is useful for a delivering a cytotoxic agent to a cell that expresses the protein by providing a cytotoxic agent to a cell that expresses the protein by providing a cytotoxic agent to call that expresses the protein by providing a cytotoxic agent to manipody and exposing the cell compared to the antibody agent to a cell that expresses the protein by providing a cytotoxic agent to acell that expresses the protein of compared to antibody and exposing the compared of the protein of contract cells or treating a mammalian immune response the protein, for generating a mammalian immune response of the protein, for detecting the presence of the protein or polymucleotide in a biological ample in a patient who has or who is suspected of having cancer and for monitoring 85P183 in a biological end on human chromosome 15914. New compositions comprising a gene (designated 158P1D7), its encoded protein or their modulators, useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. dogs, cats, cows, horses or numans)

Example 1; Page 68; 181pp; English.

The invention relates to a novel nucleic acid, designated 158P1D7. The compositions are useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. mice, rats, rabbits, dogs, cats, cows, horses or humans). The compositions are also useful for monitoring genetic abnormalities and in preparing cancer vaccines. The nucleic acid of the invention can be used in gene therapy to treat the said disorders. This polynucleotide sequence represents a PCR primer of the 158P1D7 CDNA of the invention 88888888888

Composition comprising a substance that modulates the status of a zinc transporter protein (108P5H8), useful in diagnosing and treating patients with cancer that express 108P5H8, such as breast, colon, ovarian or lung cancer.

Example 1; Page 95; 309pp; English.

The invention relates to a new composition comprising a substance that modulates the status of a zinc transporter protein, designated as modulates. The composition is 108P5H8, or a molecula that is modulated by 108P5H8. The composition is useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 108P5H8, such as breast, colon, ovarian or lung cancer. The 108P5H8 ene or its fragment can be used to elicit a humoral or cellular immune response. The antibodies are useful in active or passive immunisation. The 108P5H8 polymucleotides are useful in active and primers for the amplification or detection of 108P5H8 genes, as coding sequences for directing the expression of 108P5H8 genes. The polymucleotides of the invention can be used to treat disorders by gene therapy. This polymucleotide sequence represents a zinc transporter protein 108P5H8 related PCR primer of the invention

The composition of the modulates the status of a protein, 12192A3. The composition of the invention has expostatic and immunostimulant activity, and is useful as a vaccine. The 12192A3 proteins and polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal colline is a tools that can be used to delineate cytogenetic abnormalities of this chromosomal region that encodes 12192A3 that may contribute to in the chromosomal region that encodes 12192A3 that may contribute to malignant phenotype, and in assessing the status of 12192A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 12192A3 are aparticular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The present sequence represents an nested CP or primer used in the invention to amplify gene fragments resulting from suppression subtractive hybridisation (SSH) reactions
                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ä

The composition is useful for treating cancer. This sequence represents

Katz E, Pabalan J, Aguilar D; Li Y, Sandrasagra A, Ka Tang L, Shahabuddin S; Nyce JW, 1 Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 13919; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intitation codon, coding region, 5. or 3. end genomic flanking regions, 5. and 3. intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or neasl alraway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, companyepressive, and cytostaric activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a core preventing a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing or depleting levels of, uniquinone or lung surfactant in a subject of the cathoring bronchocilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence at for sequences or condition.

Condition the printed prophylactic fersion or represented in the printed specification, but was obtained in electronic format directly from WIPO contents.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure, SEQ ID NO 7616, 872pp, English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' or and genomic flanking regions; 5' and 3' intron-exon junctions, 5' or 3' or region within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antistense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallignant disease or condition, as 1so for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodialation, increasing levels of adenosine receptor, producing bronchodialation, increasing levels of adenosine receptor, producing bronchodialation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease; or condition or lung inflammation, lung abeten is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

New antisense oligonucleotides for modulating insulin-like growth factor binding protein 5 gene expression, useful for preventing or treating cancers, inflammatory disorders, developmental disorders or metabolic disorders.

Claim 3; Page 76; 105pp; English.

Sequences ACC47637.ACC47667 represent phosphorothicate antisense cligonuclectides targeted to the human insulin-like growth factor binding protein 5 (IGFBPS) gane, which inhibit its expression. The antisense cligonuclectides were designed to target different regions of human coligonuclectides were designed to target different regions of human IGFBPS RNA, and were analysed for their effect on IGFBPS expression by quantitative real-time PCR. IGFBPS (also known as IBPS) is a member of the insulin-like growth factor superfamily, which are involved in the regulation of IGF action and bioavailablity, and which also mediate IGFP. Independent actions, including inhibition or enhancement of apoptosis. IGFBPS is a key component of the IGF system in bone, having a high specific binding affinity for hydroxyapatite and extracellular matrix of proteins, and appears to act as a growth factor, stimulating bone of proteins, and appears to act as a growth factor, stimulating bone of proteins, and appears to act as a growth factor, stimulating bone of proteins, and appears, notochord, muscle cells in a experimental model collis. It is also thought to play a role in prostate cancer of colitis. It is also thought to play a role in prostate cancer of colitis. It is expressed which high frequency in neuroendocrine tumours, and has been shown to be induced in breast cancer cells upon treatment with anticestrogens used to abolish tamoxifen resistant proliferation. The oligonucleotides of the invention and treatment of invention and treatment of information and treatment of information are useful for diagnosis, or prostate, pancreas of the invention and treatment of information and treatment of information and treatment of information and treatment of invention and treatment of invention and treatment of information and treatment of information and treatment of invention and treatment of information and treatment of invention and

Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.

Example 2; Page 22; 50pp; English.

This invention describes a novel antigenic peptide comprising amino acid residues of an IgB CH3 domain from a first species (ADE1) and amino acid residues of an IgB CH3 domain from a first species (ADE2), where ADE1 is conserved in the IgE CH3 domain of the second apecies and ADE2 is not conserved in the IgE CH3 domain of the second species and ADE2 is not conserved in the IgE CH3 domain of the first species. The novel antigenic peptide induces a non-anaphylactic anti-IgE immune response in a nanimal. The invention also discloses the polynucleotide sequence conciding the antigenic peptide and an antigenic fusion protein comprising the antigenic peptide of the invention and a heterologous protein comprising the antigenic peptide of the invention and an enti-IgE immune response that does not cause anaphylaxis when administered to an animal. The carrier, where the fusion protein induces an anti-IgE immune response that does not cause anaphylaxis when administered to an animal. The products of the invention are useful in the manufacture of preventing IgE from binding to high affinity receptors on mast cells and operation are useful in the manufacture of a medicament for treating or preventing IgE-mediated allergic disorders including asthma, allergic rhinities, gastrointestinal allergic disorders consorted announced including asthma, allergic rhinities, gastrointestinal allergic disorders including asthma, allergic rhinities, gastrointestinal allergic disorders consorted products are useful for treating IgE-mediated allergic disorders by gene therapy. Antigenic peptides comprising conserved amino conditived by variable amino acid residues of the CH3 domain of an IgE molecule from as second unrelated species are capable of inducing a high titre of antitre of antibodies when administered to an animal without causing anaphylaxis. ACASIBH4-ACASIBH6 represent PCR primers used to amplify the polymucleotide sequences used in designing the constructs

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding dual specific phosphatase 5, where the compound specifically hybridises with and inhibits the expression of dual specific phosphatase 5. The compound is used for treating an animal having a disease or condition associated with dual specific phosphatase 5 such as a hyperproliferative disorder, a developmental disorder, an inflammatory disorder or a disease which arises from aberrant apoptosis. Sequences ASK09162-ABX09139 represent human dual specific phosphatase 5 phosphorothioate oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; immunostimulant; 162P1E6; cytotoxic agent; immune response; cancer; bladder; prostate; kidney; lung; breast; passive immunisation; transgenic animal; vaccine; gene therapy; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel composition comprising a substance that modulates the status of a 1519304 protein (e.g. 1519304 variant 1-11; or a molecule that is modulated by the 1519304 protein, where the status of a cell that expresses the 1519304 protein is modulated. The novel compositions, or the 1519304 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This polynucleotide sequence represents a 1519304 related primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

The invention relates to a novel composition comprising a substance that modulates the status of a 162P1E6 protein. The protein comprises one of 21 sequences of 70 - 146 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of a cell that expresses the protein is modulated. An antibody to the 162P1E6 protein is used to deliver a cytotoxic agent or a diagnostic agent to a cell that expresses the 162P1E6 protein. The composition is used to inhibit the growth of cancer cells or generate an immune response. The composition is used for detecting the presence of a 162P1E6 related protein or a learned or detecting them are useful for diagnosing, proteins and polymuclectide in a sample. The 162P1E6 proteins and polymuclectide in a bander cancer, prostate cancer, kidney cancer, lung cancer, such as bladder cancer. They can be used for eliciting a humoral or cellular immune response. The also be used for eliciting a humoral or cellular immune response. The passive immunisation. Transgenic animals are useful for developing and screening of useful reagents. The polymuclectide and polypetide screening of the invention can also be used to treat disorders by being used in a vaccine or in gene therapy. This polymuclectide sequence
                                                                                                                                                                                                                                                                                                                                                   Composition for diagnosing, prognosing, preventing or treating cancer, for eliciting a humoral or cellular immune response, or for active or passive immunization, comprises a substance that modulates the status of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Suppressive subtractive hybridisation of STEAP related primer #8.

```
The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This sequence represents a primer used to analyse human six transmembrane epithelial antigen of the prostate or STEAP-1 cDNA's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```

Example 1; Page 72; 1021pp; English

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the disposais and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a primer, used in an example from the invention

Challita-Eid

ö New pharmaceutical composition for diagnosing, prognosing, preventing of treating cancer, comprises a substance that modulates a nucleic acid sequence, e.g. 105P1B7, 152P1A2B or 156P3A6, or a molecule modulated by the nucleic acid.

The invention comprises the amino acid and coding sequence of a 184PIE2 protein. The DNA and protein sequences of the invention are useful for diagnosing, prognosing and/or treating cancer. The 184PIE2 DNA and protein sequences may also be used to elicit a humoral or a cellular immune response in patients and in monitoring genetic abnormalities. Antibodies raised against the 184PIE2 proteins may be use in active or passive immunisation. The present DNA sequence is used in the exemplification of the invention

ö status of a cell that expresses the nucleic acid sequence is modulated. The composition is useful in diagnosing, prognosing, preventing and/or treating cancer. The nucleic acid sequence may be used in monitoring genetic abnormalities, in generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to a protein, and in therapeutic and diagnostic contexts, such as diagnostic sasays, cancer vaccines, and methods of preparing vaccines. The present sequence is a primer used to identify the cancer associated coding sequences suitable to be modulated in the method of the invention New 184PIE2 polynucleotide encoding a 184PIE2 protein, useful for diagnosing, prognosing, preventing or treating cancer, in eliciting an immune response, and in chromosome mapping. The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGFR-3) ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Phosphorothioate backbone, All cytidine residues are 5-methylcytidines"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BLCL2-associated X (BAX) protein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition of 13 and a pharmaceutical carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compounds, useful for modulating the expression of BCL2-sasociated X (BXX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's disease or Alzheimer's disease.
                                                                                                                                                                                                                                                                              BCL2-associated X; BAX; nootropic; neuroprotective; antiparkinsonian; anticonvulsant; ophthalmological; antidiabetic; virucide; antisense therapy; BAX antagonist; BAX inhibitor; familial amylotrophic lateral sclerosis; Alzheimer's disease; Parkinson's disease; Hodgin's disease; cartilage-hair hyperplasia; diabetes-associated ocular disorder; scrapie infection; aberrant apoptosis; human; phosphorothioate; ss.

cc tissues comprising the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (1); and (3)

Cc treating an animal having a disease or condition associated with BAX

protein comprising administering to the animal (1) so that expression of

BAX protein is inhibited. (1) has nootropic, neuroprotective,

antiparkinsonian, anticonvulsant, ophthalmological, antidiabetic and

virucide activities, and can be used in antisense therapy, and as a BAX

attagonist. The antisense compounds (1) are useful for modulating the

expression of BAX protein, and for treating a disease or condition

associated with BAX protein, e.g. familial amylotrophic lateral

cartilage-hair hyperplasia, disease, parkinson's disease, Hodgkin's disease,

cartilage-hair hyperplasia, diabetes-associated ocular disorders or

scrapie infection, or a condition that arises from abbrrant apoptosis.

The compounds are useful as research reagents and in diagnostics. The

present sequence represents a human BAX chimeric phosphorothioate

oligonucleotide, which is used in an example from the present invention.

Modulating growth, differentiation or survival of a cell, useful for treating a degenerative disorder of the nervous system characterized by neuronal cell death, comprises contacting the cell with a hedgehog polypeptide.

Example 4; Page 44; 121pp; English.

The invention relates to a method for modulating growth, differentiation or survival of a cell, comprising contacting the cell with a hedgehog polypeptide. The invention also relates to methods for inducing a cell to differentiate to a neuronal cell phenotype comprising a cell to differentiate to a neuronal cell phenotype comprising contacting a cell to carget tissue of a hedgehog polypeptide commission contacting a degenerative disorder of the nervous system characterised by neuronal cell death, comprising administering a hedgehog polypeptide causing prolonged survival of neural cells in the patient, relative to the absence of hedgehog propeptide are using prolonged survival of neural cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are using a degenerative disorder of the nervous system characterised by neuronal cell death, including content of the nervous system characterised by neurons of hedgens are disorders, including content and social sease, Parkinson's disease, multiple content and social demase resulting from anoxia, ischaemia or trauma and neuronal degeneration associated with a natural aging process. The neuronal degeneration associated with a natural aging process. The neuronal degeneration associated with a natural aging process. The chosen including disorders affecting innervation of smooth muscle and disorders affecting innervation of smooth muscle and peripheral nerve damage, for treating neoplastic or hyperplastic carriptement of stranformations and in controlling the development of stem cells crepairing central responsible for the heart, in nerve proscheses for repairing central responsible for the formation of the digestive tract, liver and other organs. This sequence represents a PCR primer used to amplify zebrafish

```
The present invention describes a human sulfatase enzyme (I), which is located on chromosome X (more specifically to Xp22.33). (I) has cardiant, neuroprotective, antiparkinsonian, analgesic, cerebroprotective, cardiovascular, antiantantor, antianaemic, cerebroprotective, cardiovascular, antianthythmic, antianaemic, cerebroprotective, cardiovascular, antianthythmic, antianaemic, cerebroprotective, cardiovascular, antianthythmic, antianaemic, cordivities, and can be used in gene therapy. The sulfatase polymuclectide and polypeptide sequences can be used in diagnosing, preventing, candiorating or treating diseases associated with sulfatase dysfunction. They may also be used to identify test compounds that may act, for example, as activators or inhibitors at the enzyme's active site. The human sulfatase and its fragments are also useful in raising specific antibodies that can block the enzyme and effectively reduce its activity. The sulfatase can be used in the treatment of diseases such as cancer, a central nervous system (CNS) disorder (e.g. Alzheimer's disease, cordivators or parkinson's disease, stroke or neuropathic pain), a cardiovascular cordisorder (e.g. heart failure or arrhythmias), a haematological disorder (e.g. anaemia or thrombocytopaenia), a genitourinary disorder (e.g. renal cordinary disease (CDP)) or asthma. The present corporation obstructive pulmonary disease (CDP) or asthma. The present corporation or example from the present invention
                                                                                                                   New polynucleotide encoding a sulfatase polypeptide, useful for diagnosing, preventing or treating diseases associated with sulfatase dysfunction, e.g. cancer, asthma or cardiovascular disorders.

New antisense compounds, useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha, and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha.

Example 15; Col 43-44; 35pp; English

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha inhibitory oligomucleotide

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound specifically hybridises with the nucleic acid molecule encoding complement component C3, or specifically hybridises with at least an 8-nucleobase component C3, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding complement component C3. Also included are a composition comprising the component C3 in cells or tissues (comprising the expression of complement component C3 in cells or tissues (comprising complement C3 in cells or tissues) component C3 in cells or tissues with complement component C3 compounds are useful for inhibiting the expression of complement component C3 compounds are useful for inhibiting the expression of complement C3 in cells or tissues, or for treating an animal having a compound cited above so that compound can associated with complement component C3 in cells or tissues, or for treating an animal having a cutoinmune disorder (e.g. multiple solerosis), an infection, or atherosclerosis, inflammation, septic shock, multiple organ failure, cuseful as research reagents and diagnostics, in distinguishing functions of various members of a biological pathway, or for preventing or delaying complement component c3 in distinguishing functions inflammation or tumour formation. New homogeneous prodrug conjugate containing hepatic ligand for delivery of pathogen-specific oligomer useful for treating liver infections or

Disclosure, Page 23; 107pp; English.

The invention relates to a novel homogeneous conjugate comprising a hepatic ligand, bifunctional linker and biologically stable oligomer that binds to a sequence in a hepatic virus or pathogen and is released from the conjugate by hydrolysis or reduction. The conjugate of the invention may be useful during the treatment of liver diseases including chronic viral hepatitis, cirrhosis, malaria, viral or protozoan infection and cancer, such as hepatocellular carcinoma (HCC). The current sequence is that of the DNA oligonucleotide 9 of the invention which is targeted to Hepatitis C virus (HCV) sequence.

Jakobovits A; Hubert RS, Faris M, Raitano AB, Challita-Eid PM, ... volynucleotide designated 205PlB5, for diagnosing and treating prostate cancer, and as probes or primers for the amplification and/or detection of 205PlB5 genes.

Example 1; Page 60; 162pp; English.

This invention relates to a novel gene designated 205P1B5, and the encoded protein, which is aberrantly expressed in prostate cancer. Specifically, it refers to the two variants of 205P1B5 mapped to chromosome 8p21-8p12, namely 205P1B5v1 and 205P1B5v2 and fragments thereof that serve as useful diagnostic, prophylactic, prognostic, propressit cand, or therapeutic targets for prostate and other types of cancers. The present invention describes methods for the isolation of 205P1B5, for generating an immune response and for generating transgenic or knock out animals for

the development and screening of therapeutically useful reagents. Furthermore, it refers to identifying proteins, small molecules or other agents that interact with 208PIBS, and can be used to identify pathways activated by 208PIBS. Accordingly, these are cytostatic and immunogenic compositions that are useful for the development of cancer vaccines. This suppressive subtractive is the nested PCR primer 2 (NP2) used for suppressive subtractive hybridisation (SSH) to isolate the 208PIBS cDNA fragment of the invention.

New albumin fusion protein comprising a human immunodeficiency virus (HIV) fusion inhibiting peptide and an albumin having an albumin activity, useful for treating a disease or disorder, e.g. HIV infection.

Example 3; Page 58; 105pp; English.

This invention relates to novel albumin fusion proteins comprising a human immunodeficiency virus (HIV) fusion inhibiting peptide, which exhibit anti-retroviral activity. Specifically, it refers to inhibitory peptides including T-20, T-1249, 5-Helix or cyanovirin-N that bind the HIV env protein, or derivatives thereof such as the HIV gp41 protein. The Furthermore, the albumin activity has the ability to prolong the in vivo Fulfile of these HIV fusion inhibiting peptides. Accordingly, the present invention describes fusion proteins that neutralise HIV in a host or arising an immune response and also antibodies that inhibit viral infection of uninfected cells. In this way, a method exists to prevent, treat or ameliorate HIV infection and/ or a disease caused by HIV infection and/ or a disease caused by HIV infection and/ or a disease caused by HIV infection and or a disease caused by HIV infection and or a disease caused by HIV activity and can be used towards the production of a vaccine. This oligonucleotide sequence is the forward RT-PCR primer used to amplify the HIV-1 RNA in order to clone T-20, in an exemplification of the invention.

The presence of the endometriotic haptoglobin is indicative of endometriosis. The invention provides purified and isolated glycoprotein and biologically functional analogues having specific physical and functional characteristics. This sequence represents a primer used in the isolation of rat endometriotic haptoglobin ENDO-1 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Diagnose of endometriosis in female involves detecting the presence of purified and isolated endometriotic haptoglobin and its functional

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIF1 (gene and encoded protein), or a molecule that is modulated by 121PIF1, where the status of a cell that expresses 121PIF1 is modulated. The human 121PIF1 gene maps to chromosome 4g. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIF1, such as breast, colon, ovarian or lung cancer. The 121PIF1 gene or its fragment can be used to elicit a humoral or cellular immune response.

121PIF1 antibodies can be used in active or passive immunisation. 121PIF1 polynucleotides are useful as probes and primers for the amplification or detection of 121PIF1 genes, as coding sequences for the amplification or inhibiting the expression of 121PIF1 genes. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition comprising a substance that modulates the status of 121PIF1, useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIF1, such as breast, colon, ovarian or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   lung cancer
                                                                                                                                                                                 28-NOV-2002
```

This invention relates to a novel composition which comprises a substance that modulates the status of a novel protein (1612/2108) and its variants braving a sequence of 875 amino acids provided in the specification. The protein of the invention is over-expressed in certain cancers. The compounds of the invention may have cytostatic activity and the sequence of the IEDP2NOB protein, and the gene which encodes it, may be useful for gene therapy or the development of a vaccine. The composition and methods of the invention are useful in diagnosing, preventing and treating ancourt. The present sequence is that of FCR primer which was used for amplification of a region of the gene encoding the human 161P2F10B protein during the exemplification of the invention.

A composition for diagnosing, preventing and treating cancer (e.g. prostatic, renal or uterine cancer) comprises 161P2F10B polynucleotides and polypeptides.

Example 1; SEQ ID NO 36; 135pp; English.

```
This invention relates to novel composition comprising a substance that modulates the status of a 433 residue protein, given in the specification with the DNA sequence encoding it, or a molecule that is modulated by the protein. The novel protein 193P121B exhibits tissue specific expression in normal adult tissue and is aberrantly expressed in certain cancers. Compositions which modulate the 193P121B protein may have cytogratic activity and the DNA sequence which encodes protein 193P121B may be useful in gene therapy. The composition of the invention may be useful primer which was used for the amplification of human 193P121B gene DNA during the exemplification of the invention.
                                                                                                                                                                                          New composition comprising 193P1E18-related protein, useful for preventing or treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 5 C; 10 G; 2 T; 0 U; 0 Other;

New oligonucleotides, nucleic acid probes and primers are useful for differentiating drug-resistance and determining infection with tubercle bacilli.

Claim 21; Page 40; 114pp; English.

The present invention relates to oligonucleotides based on nucleotide sequences obtained from both wild-type tubercle bacilli (wrTB) that are succeptible to a drug and mutant-type tubercle bacilli (mrTB) that are resistant to a drug. The drugs used in the present invention are

```
rifampicin (RPP), streptomycin (SM), kanamycin (KM), isoniazid (INH) and ethambutol (EB). The trops gene is responsible for resistance to RPP; the responsible for resistance to SM and KM, the rpst gene is responsible for resistance to SM, the inhA gene is responsible for resistance to INH; the katG gene is responsible for resistance to INH; and the embB gene is responsible for resistance to INH; and the embB gene is responsible for resistance to INH; invention also relates to nucleic acid probes having part of a nucleotide primers used to generate the probes. The present sequence is an oligonucleotide of the present invention. The oligonucleotides of the present invention. The oligonucleotides of the spread to enable the differentiation of drug resistance and the determination of infection with tubercle bacilli simultaneously

ssor genes, factor protein, Enzymatic and antisense nucleic acid inhibition of repressor useful for producing e.g. granulocyte colony stimulating fact interferon alpha and erythropoietin.

Claim 37; Page 63; 164pp; English.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogane/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (1) and nucleic acids (II) encoding (1) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                            Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene;

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (SI, ABB3939), a sequence having 65$ sequence identity to (SI), (SI) having 95$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene, foncedent for that functions as an adaptor protein that interacts with Rho family small Grasses as well as downstream components of the signal transduction pathway. (1) is useful of or identifying a specific binding partner. (7) and nucleic acids (11) for oused by altered expression of human POSHL1 including diagnosing and caused by altered expression of human POSHL1 including diagnosing and causeful for measuring and for surveying gene expression and creating are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to

Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The
                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

ô
present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (SI, ABB3939), a sequence having 6$$ sequence identity to (SI), (SI) having 9$$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 11s a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsass as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding pattner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is
                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, POSHL 1; SH3 domain, POSH-like signalling protein 1, oncoge:

useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence did not form part of the Derwent by the Buropean Patent Office

Tuijnder M; Telerman A, Amson R,

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. WPI; 2003-333167/31.

Disclosure; Page 312; 738pp; French.

The present invention relates to murine oligonucleotides (ACC62754-ACC68066), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

Antisense compound, 8-30 nucleobases in length, inhibiting the expression Ets-2 is useful for treating cancer and detecting Ets-2 expression.

Claim 3; Col 40; 31pp; English.

Sequences AAA38349-A38388 represent antisense oligonuclectides targetted to the human Ets-2 gene, which inhibit its expression. The antisense oligonuclectides were designed to target different regions of the human Ets-2 RNA, and were analysed for their effect on Ets-2 RNA levels by Ets-2 RNA levels by Camilitative real-time FCR. The Ets-domain transcription factors are a family of proteins which are involved in controlling key callular events contains a proliferation, differentiation and development. The Ets domain is a DNA-binding domain shared by all members of this family. Through this cat a GCA consentus sequence, thereby acting as either repressors or atta GCA consentus sequence, thereby acting as either repressors or activators of the gene. All but one Ets family protein bind to DNA as a conomer. Ets-2 has been implicated in the regulation of callular corrections associated with malignancies. Ets-2 has been found to be translocations associated with malignancies. Ets-2 has been found to be translocations associated with malignancies. Ets-2 has been found to be translocations associated with malignancies. Ets-2 has been found to be upregulated in several cancers, including lymphoblastic leukaemia. It may calso play a role in the cancer phenotype, as it activates the urokinase of plasminogen activator (upp) promoter and the promoters of continuation. High levels of upp and metalloproteinases are associated with tumour invasion and metatasis in breast cancers. As the Ets-2 gene is located on chromosome 21, which is triplicated in Down's syndrome, it is also thought to be responsible for the skeletal abnormalities present to this condition. The artisense of conditions associated with Ets-2 expression, especially cancer

AAV46388-V46391 are PCR primers used in the isolation of a perchloroethane dehalogenase (PCE-DH) isolated from Dehalospirillum multivorans. This protein is used in a process for microbiological purfiication of water conteminated with chlorinated ethylenes and/or chlorinated propylenes. The process involves adding an electron donor a passing the water through a bioreactor containing a syntroppic mixed culture immobilised on a support, where the culture comprises at least one dehalogenating bacterium and at least one hydrogen-producing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Microbiological purification of water contaminated with chlorinated olefin(8) - using combination of dehalogenating and hydrogen-producing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for detecting non-responders to anti-tumour necrosis factor (TNF) therapy. The method involves testing an individual for homozygosity for at least one single nucleotide polymorphism (SNP) in the gene coding for TNF receptor II, which is located on chromosome 1p36. Two novel SNPs, one in exon 2 (position 168 A/G) and one in exon 6 (position 5NPs, one in exon 2 (position 168 Met196Arg respectively, are also described. The method of the invention is useful for detecting non-responders to anti-TNF therapy such as infliximab therapy, or therapy of Crohn's disease. The genes containing the 2 novel polymorphisms are useful for diagnostic purposes in inflammatory, malignant or other chronic diseases. ABK33417-ABK33440 represent PCR primers used to amplify different regions of the human TNF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting non-responders to anti-human necrosis factor therapy, comprises testing an individual for homozygosity for a single nucleotide polymorphism in the gene coding for the tumor necrosis factor receptor

This sequence represents a preferred antisense oligomucleotide targetted against the gene encoding human microtubule-associated protein 4 (MAP4). Inhibition of MAP4 expression was measured by determination of MAP4 mRNA levels in a variety of cell lines via real-time quantitative PCR. The cell lines used included the bladder carcinoma cell line PCR. The numan lung carcinoma cell line A549, human neonatal dermal fibroblasts and human embryonic keratinocytes. Microtubule-associated proteins comprise a group of proteins that mediate microtubule assembly and function which is required for cytoskeletal integrity. MAP4 is a member of the non-neuronal strabilising the microtubule lattice. MAP4 expression, and is therefore elevated in cells with mutant p53 oncogene expression, and is therefore linked to cancer chemcherapeutic drug sensitivity. These antisense concerning animals, particularly mamnas, having or being prone to a disease or condition associated with the expression of MAP4. The oligomucleotides are also useful for research and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense oligonucleotides for inhibiting microtubule-associated protein 4 expression, useful in treating disorders associated with microtubule protein expression.
                                                                                                                              methoxyethyl (2'-MOE) nucleotides"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8X4X5X8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primers AAX21358-X21359 were used to PCR amplify a fragment of the 17DE1 locus sequence as a control sequence for analysis of BAI gene expression in blots. The BAI genes (see AAX21355-X2137) are expressed specifically in the brain and play an important role in cancer formation in the brain. The BAI proteins can be used in drug compositions to diagnose, prevent or

Thymosin-beta-10-like protein; ephrin type-A receptor 8-like protein; 85; proteoglycan-like protein; fibromodulin; fibromectin; thymic immune cell; spermatogenesis; male infertility; neoplasia; red blood cell; platelet; small cell lung cancer; GPI-anchored ephrin-A ligand; prostate cancer; neurological disorder; cardiac disorder; vascular disorder; orthopaedic; inflammatory disease; rheumatoid archritis; connective tissue; congenital muscular dystrophy; chemotherapy; immunotherapy; PCR primer; BC 2.7.1.112.
                                                                                                                                                                                                                                                                                                                                   The specification describes a pre-trans-splicing molecule (PTM) which contains one or more target binding domains, a 3' splice region comprising a branch point, a pyrimidine tract and a 3' splice acceptor site, a spacer region separating the mRNA splice region from the target binding domain, and a nucleotide sequence to be trans-spliced. The method is used for the in vivo production of a trans-spliced molecule in a subset of cells. The PTM is used for producing chimeric mRNA molecule by contacting it with target pre mRNA which is useful for gene regulation, gene repair and targeted cell death particularly repair of cystic fibrosis trans-membrane regulator gene. The present primer was used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a pre-trans-splicing molecule (PTM) which contains one or more target binding domains, a 3' splice region comprising a branch point, a pyrimidine tract and a 3' splice region first site, a spacer region separating the mRNA splice region from the target binding domain, and a nucleotide sequence to be trans-spliced. The method is used for the in vivo production of a trans-spliced molecule in a subset of cells. The PTM is used for producing chimeric mRNA molecule by contacting it with target pre mRNA which is useful for gene regulation, gene repair and targeted cell death particularly repair of cystic fibrosis trans-membrane regulator gene. The present primer was used in

The sequence represents a PCR primer used in expression analysis of ephrin type-A receptor 8-like protein (NOV1). Thymosin-beta-10-like protein (NOV1), ephrin type-A receptor 8-like protein and proteoglycan-common to the diagnosis, treatment and proteins (NOV3) may be used in the diagnosis, treatment and proteins (NOV3) may be used in the diagnosis, treatment and proteins (NOV3) may be used in the diagnosis, treatment and chirchnectin. The polypetides of the invention are useful in screening for agents that modulate their activity, and in determining predispositions to disorders. NOV1 is useful for treating conditions involving development, differentiation, and activation of thymic immune cells, in pathologies related to spermatogenesis and male infertility, diagnosis of neophasias, in diseases or pathologies of red blood cells or platelets, in detection of small cell lung cancer. NOV1 nucleic acids can be combined in chemo-immunotherapeutical anti-cancer treatments. NOV2 is useful for detecting cells expressing GPI-anchored ephrin-A ligands, as a marker for prostate cancer, and in treating cells acids and proteins are useful for treating orthopasedic disorders and/or injuries, and inflammatory diseases of connective tissues e.g. rheumatoid arthritis, congenital muscular dispendents. New isolated polypeptides, NOV 1-3, having identity to thymosin-beta-10, ephrin type-A receptor 8 and proteoglycans, and polymucheotides, useful for treating male infertility, neurological or cardiac disease or rheumatoid arthritis. Example 1; Page 83; 102pp; English.

Novel membrane bound and secreted NOV polypeptides, for treating, diagnosing and preventing male infertility, neurological, cardiac and arthritis.

Example 1; Page 118; 180pp; English.

The present invention relates to novel membrane bound and secreted NOV proteins and polynuclectides encoding such proteins. Sequences of the proteins and polynuclectides encoding such proteins. Sequences of the invention are useful for treating a medicament for treating a syndrome associated with human disease. They are useful for determining the associated with human disease. They are useful for determining the presence of or predisposition to lung cancer. NOVI compounds are useful for development, differentiation and activation of thymic immune cells, pathologies related to spermatogenesis and male infertility, diagnosis of several human neoplasias and diseases or pathologies of cells in blood circulation such as red blood cells and platelets. NOVI nucleic acids are useful for detecting specific cell types and as specific marker for cancers in tissues. NOV2 and NOV4 compounds are useful for treating system and angiogenesis and for treating cardiac and vascular pathologies. NOV3 and NOV5 compounds are useful for treating vascular pathologies. NOV3 and NOV5 compounds are useful for treating vascular pathologies. NOV3 and NOV5 compounds congenital muscular dystrophies, various muscular disorders indicated congenital muscular dystrophies, various muscular disorders, fixed for treating atopy, dysprothrombinaemia, hypoprothrombinaemia, type I and Correcting atopy, dysprothrombinaemia, hypoprothrombinaemia, type I and Cype, macular dystrophy, vitelliform type, McArdle disease, type 2 McCkellyphone, multiple endocrine neoplasial, multiple mysolome, multiple endocrine neoplasial, multiple mysolome, somatorrophinome, cype, macular dystrophy, vitelliform type, McArdle disease, type 2 McKellyphone, multiple endocrine neoplasial, multiple mysolome, somatorrophinome, sequence is specific por primer. This sequence is used in the exemplification of the invention

(INTR-) INTRONN INC.

Novel cell having pre-trans-splicing molecules with target binding domains that target binding of PTM to pre-mRNA, 3' or 5' splice region, spacer region, nucleotide sequence to be trans-spliced to target-pre-Garcia-Blanco MA, Baker CC, Puttaraju M; Chao H; WPI; 2002-566693/60. Mitchell LG, Mansfield GS,

Example; Page 53; 229pp; English.

The present invention describes a cell (I) comprising pre-trans-splicing molecules (PTMs) (II) which have one or more target binding domains (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIb) that circledes branch point pyrimidine tract and 3'splice acceptor site, or 5' splice site (IIc), spacer region (IId) that separates RNA splice site from target binding domain, and mucleotide sequence to (IIe) be transcomprising: (A) (IIb) and (IIe), the cell comprises (II) either comprising: (A) (IIb) and antimicrobial activities, and can be used in gene therapy. (II) comprising one or more (preferably two or more) (IIa) and (IIe), or (II) (IId) and (IIe), or (II) comprising one or more (preferably two or more) (IIa) and (IIb), (a useful for producing a chimeric RNA produced comprises sequence to be transcomponents. The chimeric cell which involves concacting a target pre-mRNA expressed in the cell with (II) that is recognised by nuclear splicing components. The chimeric comprises nucleotide sequences comprising exons 1-10 of cystic preferably comprises nucleotide sequences comprising exons 1-10 of cystic fibrosis trans-membrane conductance regulator (GTRN). The chimeric RNA molecule produced using (II) which either comprises (A) or (B) comprises a nucleotide sequence to be trans-spliced to target pre-mRNA comprises and targeted cell death. (I) can be used for the treatment of comprises and targeted cell death. (I) can be used for the treatment of comprises and targeted cell death. (I) can be used for the treatment of comprises and diseases including genetic, infectious or autoimmune diseases and communistical produced ascener inventions or autoimmune diseases and communistical produced ascener inventions and to regulate gene expression in the present inventions the present interval.

Arraying genome clones.

Claim 4; Page 22; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the marker is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell cand lateral directions; (f) the mixed clones are cultured and the call three in the multiwell plates of the specified to midted respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the multiwell plates are specified from the amplified products; (h) the clones in the constituted as the positions on the chromosome and arrayed. The mixed reconstituted as the positions on the chromosome and arrayed. The mixed promess for human chromosome light-312 to ABL43531 to ABL43531 to PRE primers for human chromosome 21q22.1, which are specified as the present invention in the present invention

Quantitating messenger RNA in sample - using immobilised-polynucleotide having sequence complementary to sequence unique to the MRNA.

Example 9; Page 71; 177pp; English.

The sequences given in AAQ47594-603 show regions of homology between jun sequences and the jun-B specific probe B-1258 which may be of use as jun-B specific probes. They were used in the method of the invention for the getection and quantification of mRMAs in a sample without the need to detection and quantification of mRMAs in a sample without the need to purify the mRMA from cells. The claimed method comprises identifying a purify the mRMA from cells. The claimed method comprises identifying a polymucleotide sequence unique to the mRMA, and immobilising an oligomer components are washed from the support such that the unique sequence then incubated with the insoluble support such that the unique sequence components are washed from the support and bound RMA is labelled in such components are washed from the support. The amount of bound label is then a way that the label is incorporated onto the support relative to the amount of mRMA on the support. The amount of bound label is fine confortation of maltiple varieties of mRMA. It may be used for clearmined. This method can be used for the reliable, rapid, simultaneous conspanition of maltiple varieties of mRMA. It may be used for clearning and recognition of pathophysiology of various disease states, cancer, and infectious disease states. Contection is the molecular basis of hereditary of sprotein is the molecular basis of hereditary of contain mutant ds proteins. G proteins are also involved in invasive contain metastatic melanoma cells, and diabetes. See also AAQ473B1-666.

```
AAT50887-T50904 represent oligomucleotides of the invention. These sequences are all probes for interleukin-6 receptor (IL-6R) mRNA. IL-6 is one of the most well characterised of the cytokines. It functions through interacting with at least two transmembrane glycoprotein receptor molecules on the surface of target cells. The receptors are the IL-6R, and the signal transducer gp130. Signal transduction by IL-6 involves the concerted action of both IL-6R and gp130. IL-6 overproduction is implicated in many different disease states, particularly in cellular proliferation associated with these diseases. These sequences bind to the IL-6R coding sequence, thereby inhibiting IL-6R production. The sequences therefore inhibit the functioning of IL-6. These sequences can be used for inhibiting disease-associated cellular proliferation. The coligonucleotides are especially useful for treating cancer (e.g. renal cell carcinoma), autoimmune diseases or viral infections. They can also be used as probes for detecting IL-6 receptor mRNA, especially for evaluating the effectiveness of drugs in reducing IL-6 receptor mRNA
                                                                                                                                                    Probe, interleukin-6 receptor, IL-6R; cytokine, cellular proliferation, transmembrane glycoprotein receptor; signal transducer; gp130; inhibitor; IL-6; cancer; renal cell carcinoma; autoimmune disease; viral infection;

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

Claim 4; Page 46; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGE). A patient (preferably human) having a condition associated with the level of the fms-like tyxosine kinase 1 (EL-1), kinase insert domain containing receptor (XDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXX7275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

(first entry) 17-NOV-1997 Oligo #13 used to isolate human chromosome 16 sequences.

Human; netrin; ATPase binding cassette transporter; ribosomal L3; augmenter of liver regeneration; hNET; hABC3; SEM L3; hALR; chromosome 16; exon trapping; axon; chicken; laminin domain; C. elegans;

GENZ ) GENZYME CORP

```
The sequences given in AAT85503-06 are oligos which were used in the isolation of coding sequences from human chromosome 16. The invention contains details of the sequences encoding human netrin (NNET), human ATPASS Binding Osssette transporter (NABG3), human ribosomal L3 (SEM L3), and human augmenter of liver regeneration (NARR). The NNET gene can be used to develop chemostractants for use in axon regeneration. The hABG3 gene may be used in therapeutic applications for cystic fibrosis. The hABC3 gene may be used to develop products for treating damaged liver and liver diseases. The products can also be used for detection, diagnosis and screening assays. These oligonucleotides of may be used as primers in exon trap amplification experiments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, netrin; ATPase binding cassette transporter; ribosomal L3; augmenter of liver regeneration; NNET; hABC3; SEM L3; hALR; chromosome 16; exon trapping; axon; chicken; laminin domain; C. elegans; UNC-6; cystic fibrosis; ss.
                                                                                                                                                                                                                                                                                              New isolated human chromosome 16 genes - encode netrin, ATPase binding cassette transporter, ribosomal L3 sub-type or augmenter of liver

                                                                                                                                                                                     The sequences given in AAPBS475-83 hybridise under stringent conditions to the sequence encoding the ATPase binding cassette transporter protein (hBABC3). The hABC3 genomic sequence was isolated from human chromosome 16 by exon trapping. hABC3 cDNA contains an open reading frame of 1685 amino acids. Comparison of ABC1, ABC2 and hABC3 reveals significant conservation in the regions surrounding the two ATP binding cassettes. The ATP binding cassettes of hABC3 flank a large linker domain containing numerous polar residues. The presence of these features in the linker domain suggests that this domain may play a regulatory role similar to the R domain of CPTR. The hABC3 gene may be used in therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; netrin; ATPase binding cassette transporter; ribosomal L3; augmenter of liver regeneration; hNET; hABC3; SEM L3; hALR; chromosome 16; exon trapping; axon; chicken; laminin domain; C. elegans; UNC-6; cystic fibrosis; ss.

The sequences given in AAT85475-83 hybridise under stringent conditions to the sequence encoding the ATPase binding cassette transporter protein (hABC3). The hABC3 genomic sequence was isolated from human chromosome 16 by exon trapping. hABC3 cDNA contains an open reading frame of 1685 amino acids. Comparison of ABC1, ABC2 and hABC3 reveals significant conservation in the regions surrounding the two ATP binding cassettes. The ATP binding cassettes of hABC3 flank a large linker domain containing domain suggests that this domain may play a regulatory role similar to the R domain of CFTR. The hABC3 gene may be used in therapeutic

Jarvis I, Mcswiggen JA, Stinchcomb DT;

WPI; 1998-427942/36.

Enzymatic nucleic acid molecules which specifically cleave RNA derived from a c-fos gene - useful for treating conditions related to levels of c-fos, especially cancer.

Claim 2, Page 50, 72pp, English.

The present invention describes an enzymatic nucleic acid molecule which specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540 and AAV95541 to AAV95541 represent harmerhead ribozymes and hairpin ribozymes, respectively, which specifically cleave human c-fos. AAV95261 to AAV95400 and AAV95585 to AAV95628 represent human c-fos target cancer associated with elevated levels of c-fos oncogene, especially leukaemias, neuroblastomas and lung, breast and colon cancers. The ribozymes may also be used a diagnostic tools to examine genetic drift and mutations within diseased cells, or to detect the presence of c-fos RNA in a cell

Partial DNA sequences from these genes were isolated using exon traps AAW46753-57. Genetrapper, 3' RACE and RT-PCR were employed to identify additional sequences. The antisense coligonuclectides of the isolated sequences are used to modulate expression of hNET, hABC3, RP131 or hALR, and prevent its translation. Antibodies against hNET, hABC3, RP131 and hALR can be used to block binding of their naturally occurring ligands. The host cells containing vectors with DNA inserts encoding the proteins can be used to a method for identifying compounds which bind to hNET, hABC3, RP131 or hALR. Modulation or alteration of hABC3 substrate specificity may have significant therapeutic implications for cystic fibrosis. hALR could be used in the treatment of damaged liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human chromosome 16 genes encoding netrin, ATP binding cassette transporter, ribosomal L3 and augmenter of liver regeneration proteins useful for, e.g. treatment of liver disease and cystic fibrosis.
                                                                                                                                            Human; netrin; hNET; ATP binding cassette transporter; hABC3; ribosomal L3; RPL3L; augmenter of liver regeneration; hALR; treatment; trapping; modulation; expression; antibody; identification; binding; substrate specificity; ligand; exon trap; PCR primer; amplify; ss.
                                                                                                                Primer used to clone additional sequences of ABC, NET, ALR and RPL3L.

```
oligonuclectides AAV16326-32 are used to clone addional sequences from nucleic acids encoding human ATP binding cassette transporter (hABC3).

Partial DNA sequences from the genes was isolated using exon traps additional bequences. The ABC gene is located in the PKD1 locus, between additional sequences. The ABC gene is located in the PKD1 locus, between the sequence shows homology with murine ABC1 and ABC2 genes. The ABC proteins are responsible for the transport of a wide variety of substrates across cell membranes. Proteins and across cell membranes. Proteins and across subcellular strong structural similarities. ABC transporters govern unidirectional cransport of molecules into or out of cells and across subcellular membranes. The antisense oligonucleotides of the ABC3 gene sequence are membranes. The antisense oligonucleotides of the ABC3 gene sequence are commented to modulate expression of ABC prevent its translation. Antibodies against ABC can be used to block binding of its naturally occurring cagains the cells containing vectors with DNA inserts encoding the C protein can be used in a method for identifying compounds which bind to the ABC. Modulation or alteration of hABC3 substrate specificity may have be significant therapeutic implications for cystic fibrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

Claim 37; Page 78; 164pp; English.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the GAAT Displacement Protein (CPP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRE-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha

The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNF). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                                                                                                                                                                                                                                             Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 79; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NG20). The crequlates expression of a neurite growth inhibitor gene (NG20). The collar acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NRNA motif) propersessing an NCH motif) a G-cleaver (cleaving RNA with a NRNA motif) propersessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif) propersessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif) propersessing an NCH motif) a g-cleaver (cleaving RNA with a SPA) a sinzyme (cleaving RNA with a SPA) and the presence of a divalent cation that is preferably MG<sup>2</sup>+.

Furthermore, it may be contacted with a coll to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of fone or more chargeting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the condition associated MEL, mantle-cell and treat a patient having a condition associated Mel, the level of collicular space or follicular space and the cell and treat a patient having a condition associated with the level of the condition associated with the level of the sapeies. In particular, the NOGO-targeting nucleic acid may be used to treat comprise the use of one or more content and patient having a condition associated with the level of treat central nervous system (NNS) injury model cation and central nervous system (NNS) injury model acceptovascular accident for ender a patient having a condition associated with the level of the arbity amyotrophic lateral acceptorate and advanced a disease, ataxia, Huntington's disease, central response in the model s sequence is an inozyme of the invention

(RIBO-) RIBOZYME PHARM INC. (BLAT/) BLATT L. (MCSW/) MCSWIGGEN J. (CHOW/) CHOWRIRA B M.

Blatt L, Mcswiggen J, Chowrira BM;

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids (e.g. a ribozyme or a DNAZYME) and nozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAZYME) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaving RNA with a NYM motif) pr an amberzyme (cleaving RNA with a NGM triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2^+. Purthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more

treat lymphoma, leukaemia, be-cell lymphoma, low-grade or follicular non-thedgkin's lymphoma (NLL), bulky low-grade or follicular NLL, lymphocytic leukaemia, leukaemia, be-cell lymphoma, low-grade or follicular NLL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NLL, mantle-cell lymphoma (NCL), immunocytoma (INC), small b-cell lymphocytic lymphoma, (NCL), immunocytoma (INC), small b-cell lymphocytic lymphoma, compared to cleave RNA of the NoGO gene in the presence of a divalent cation that is preferably MG-7-. Furthermore, the nucleic acid may be contacted with a cell to reduce NoGO activity of the nucleic acid may be contacted with a cell to reduce NoGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzahmar's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MLS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, dasses, muscasse, muscasse, muscasse, creates which respond to the modulation of NOGO expression. The present sequence is an amberzyme molecule of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 85; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids (e.g. a ribozyme or a nucleic and in nozyme (an endolytic nucleic acid cleaving RN with a NTM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NCH will) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NCH will). The CD20-targetting nucleic acid is used to cleave RNA of the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular nontraced with a cell low-grade or follicular nontraced with a cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, conductory arthropathy. The NOGO-tergetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, the condition associated with the level of the treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemchbrapy-induced neuropathy, and/cortexpic lackal acid may be used to treat central nervous system (CNG) injury and cerebrovascular accident CCC theratosh's disease, ataxia, Huntington's disease, cataxia, Huntington's disease, cataxia, Huntington's disease, cataxia, Huntington's disease, mescular disease, cataxia, Huntington's disease, ataxia, Hunting sequence is an inozyme of the invention

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids aribozyme or a conclain and beaving an expression of an entrangent of cleaving an expression and motify in a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) and a makezyme (cleaving RNA tith an NYN triplet), a zinzyme (cleaving RNA with a NYN motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA coff could be contacted with a cell to reduce CD20 eactivity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more chargetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-cleaked min and inflammatory virus) associated NHL, lymphocytic lymphoma, lymphoma, lymphoma, limin minimus (NHL), mantle-cell lymphoma (NCL), immunocytoma (NMC), small B-cell lymphocytic lymphoma, immune thrombocytopeania, and inflammatory arthropathy. The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1

c can be used in gene therapy and vaccine production. The hGDMLP-1

nucleic acids can be used as probes to detect, characterise and quantify

c hGDMLP-1 nucleic acids in samples, as amplification substrates, to

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

crapture proteins, as standards in assays used to determine the concentration

and/or amount specifically of hGDMLP proteins, as specific biomolecule

capture probes for surface-enhanced laser description ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

production, and in vaccines or for replacement therapy. The

colynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a

colynucleotide sequence represents an oligomer used in the screening of the

condisorders associated with the expression of hGDMLP-1. in particular heart

cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the expression of the present invention. N.B.

Crapture probes for this patent did not form part of the printed

specification, but was obtained in electronic format directly from WIPO

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify concleic acids can be used as probes to detect, characterise and quantify concleic acids the samples, as amplification substrates, to protein variants having desired phenotypic improvements and for capturessing the proteins. The hGDMLP-1 proteins or polypeptides may be concentration to and/or amount specifically of hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specific blomolecule and/or amount specifically of hGDMLP-1 proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as capture probes for surface-enhanced laser desorption ionisation, as production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The conclust associated with the expression of hGDMLP-1, in particular heart of isorders associated with the expression of hGDMLP-1, in particular heart can skeleral muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed capture of the present invention. N.B. concentration, but was obtained in electronic format directly from MIPO capture.
                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                   Shannon ME;

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 claim be used as probes to detect, characteries and duantify a nucleic acids an beamples, as amplification substrates for the recombinant engineering of hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypoptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pot_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chen W, Shannon ME;

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production.

Claim 7; Page 163; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications consist of o-methyl modification, an LNA modification, two or more phosphorothioate linkages on a terminus, or a combination of any two or

directing repair or alterations. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The coligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abbotic stress tolerance, improved contritional value (e.g. altering amino acid content of plants or conferring amino acid over production, herbicide resistance (e.g. offersting amino acid over production), herbicide resistance (e.g. grasistance, porphyric herbicide resistance or triazine resistance), disease resistance, nondified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral corphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome callering oligonucleotide of the invention

The present invention relates to human testis expressed Patched like correct invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL codon in HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is considered to human chromosome loll21. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorders include disorders edexpession or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and forcatal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and potental therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL. The present invention relates to human testis expressed Patched like CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL concerns five single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-16. for long). HTPL codon in HTPL-8 (S for short) compared to HTPL-16. for long). HTPL codon in HTPL-8 (S for short) stone organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The chart of Patched, and is a potential tumour suppressor. HTPL is to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in cuspful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorder sinclude disorders of testis, or adrenal, adult and therap and manrow, brain, kidney, lung, placenta, prostate, prostate, collingial muscle or colon function. HTPL proteins and mucleic acids are calinically useful diagnostic markers and potential therapeutic agents for male infermility and cancer. The present oligonucleotide was used in an encourted the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

%\$GGGGGGGGGGGGGGGGGGGGGK%\$\$BBB\$\$B\$B\$B\$\$B\$\$B\$\$B\$\$

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's saccome, melanoma, conditions selected from cancer, lymphoma, Ewing's saccome, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, surged with relating a patient having a condition associated with the level of ERG, by contacting a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more theraples under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNM, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnostic of conditions and diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically carametic mucleic acids molecules which regulate expression of ERG, and crayeting genes that share homology with ERG gene or ERG fusion genes. ARM/1354-ABK2219 represent nucleic acids, including antiense and caramed Crayeting genes that share homology with regulate expression of ERG, and crayeting and call molecules which regulate expression of ERG, and crayeting genes are accompanied to the invention

The invention relates to a nucleic acid molecule (I) which down regulates corpression of an Ets-related gene (ERG). (I) is useful for treating capression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions selected from the condition arthritis, psoriasis, verruca vulgaris, angiofibroma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercous sclerosis, port wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies to the treatment in the method comprises the use of one or more therapies conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or chardotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) with RMM, in the presence of a divalent confusement as Mg2+. (I) is useful for diagnosis of conditions and cation such as Mg2+. (I) is useful for diagnosis of conditions and cation such as Mg2+. (I) is useful for diagnosis of conditions and cation such as hare homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with ERG gene or ERG fusion genes. Crargeting genes that share homology with a call and mutations within diseased cells and mutations of expression of ERG, and crargeting genes and crargeting genes and conditions and conditions and conditions and conditions and cond

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (G1, ABB83999), a sequence having 65% sequence identity to (S1), (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsases as well as downstream components of the signal transduction pathway. (II) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) consetul or acused by altered expression of human POSHL1 including diagnosing and treating caused by altered expression of human POSHL1 including microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the constitution by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                       Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine; gene therapy; transgenic; ss.

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                         Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 54; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor crift shapes B NERBA), where (I) is an inozyme, decleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for creating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cantisting resistant cancer. The method involves use of other drug charapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, colorectal, nectenoscial, fluorouracil carboplatin, edatrexate, colopsity, autoinmune disease, lupus, multiple sclend and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosus, asthma, Crohar disease, unducing molecules are also useful for treating inflammatory disease such as colorin, gene therapy applications, ischemial/repervices, ceptic, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic concept.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 34; 72pp; English.

rhe invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NREM), where (I) is an inozyma, sinzyme, G-Claever or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotraxate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic

configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. treating a patient having a condition associated with the level of REL-A. The presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, displant, methotrexate, colorectherapy including paclitaxel, docetaxel, displant, edatrexate, gencitables are also useful for treating inflammatory disease such as the manual disease, lung, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury rejection, alexamen (CNS) and myocardial), glomerulonephritis, espenies alrawy inflammatory bowel disease or infection, allergic alrawy inflammation, inflammatory bowel disease or infection, and inflammation, inflammatic, septements the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò

```
regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg-2+, the enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophagel, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, completable or radiation televal, action antisense nucleic genitable or radiation therapy. The enzymatic and antisense nucleic caid molecules are also useful for treating inflammatory disease such as molecules are also useful for treating inflammatory disease, cobesity, autonimume disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischeemia/reperfusion injury content nervous system (CNS) and myocardial), glomerulonephritis, cepties, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic connection. This sequence represents the substrate of a novel enzymatic
Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. WPI; 2003-340953/32.

Claim 3; Page 33; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, 2inzwe, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat configuration associated with the level of KEL-A creating a patient having a condition associated with the level of KEL-A. (I) is useful for cleaving KNA comprising a sequence of KEL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and anticense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, carvical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chenotherapy including paclitaxel, docetaxel, cisplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, colection, and arthritis, restenosis, asthma, Crohn's disease such as entenosis, restenosis, sethemia/reperfusion injuny, colection, and arthritis, restenosis, suchma, crohn's disease, diabetes, obesity, autoimmume disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injuny, seppis, allergic airway inflammatory bowel disease or sepsis, allergic airway inflammation, inflammatory bowel disease or infection, and an expense or sepsis, allergic airway inflammation, inflammatory bowel disease or infection. The sequence represents the substrate of a novel enzymatic

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 54; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (1) which down regulates expression of a sequence encoding a subunit of nuclear factor adapa B (NFXB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and nack, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paciltaxel, docetaxel, cisplantin, methotrexate, gemiciabine or radiation therapy. The enzymatic and antisense nucleic scid molecules are also useful for treating inflammatory disease such as theumatoid arthritis, resenosis, asthma, crohn's disease, diabetes, cheumatoid disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, isohaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sequence represents the substrate of a novel enzymatic nucleic acid molecule

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 399; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 1671.2 and MDZ12 is encoded at chromosome 1671.2 and MDZ12 is encoded at chromosome 1671.2 and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The mucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and proteins are also useful for disquesting cancerize gross caids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful, lung, prostate, also useful for treating breast, ovarian, colorectal, lung, prostate, shown in ABZS9889 - ABZ62216, ABZ64544 - ABZ65531, ABZ6520 - ABZ65216, ABZ65531, ABZ65530 - ABZ65524, ABZ65530 - ABZ65524, ABZ65530 - ABZ65531, ABZ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead riboxyme; DNAzyme; inozyme; amberzyme; G-cleaver riboxyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) RNB. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNBxzymes, CC are nucleic acid decoup molecules and aptemers that DNBxzymes, Also disclosed are nucleic acid decoy molecules and aptemers that bind to HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNB. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds in modulate the expression and/or replication of HCV. The compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carpinession ench as cirrhosis, liver failure, and hepatocellular of the HCV DNAzme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ij
liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lee
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus Claim 1; Page 251; 387pp; English. nfection.

WPI; 2003-229207/22.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmarchead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and G-cleaver ribozymes, Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligomucleotides that specifically bind the Enhancer I region of HBV Genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV inverse.

Sequence 17 BP; 2 A; 7 C; 5 G; 0 T; 3 U; 0 Other;

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELPI). The NHELPI nucleic acid molecule, NHELPI polypeptide, an antibody against the protein or its antighen-binding fragment is useful in therapy. The NHELPI nucleic acid molecule, NHELPI polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELPI. The NHELPI nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELPI gene (ADC03514).

Example 2; SEQ ID NO 742; 468pp; English.

The invention relates to a nucleic acid molecule which encodes a Na+/H+ exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein of standing fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plant growth; plant growth trait modulation; Brassicaceae; Arabidopsis; Brassica; Zea; Oryza; Triticum; Hordeum; Lolium; Sorghum; Glycine; Medicago; Helianthus; Lactuca; Beta; Vitis; Solanum; Lycopersicon; Capsicum; Gossypium; Hevea; Linum; Prunus; Citrus; Populus; Pinus;

The invention describes an isolated or recombinant polypeptide (I) comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in the specification, or a conservative variant; (b) encoded by 1 of 30 sequences (S2), as given in the specification, or a conservative variant; (c) encoded by a sequence that hybridises under stringent conditions to activity of (I) is modulated to modulate a plant growth trait in a city Arabidopsis, Brassica, Zea, pricticum, Hordeum, Lollum, Sorghum, Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solanum, Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus, Brus, or Quercus, A membrod is used to detect genes for a plant growth trait. This sequence represents a polynucleotide isolated from the plant growth associated genes of the invention that can be used a a

Shen B,

New bleomycin gene cluster components useful for peptide and/or polyketide metabolites, especially bleomycin, production and for chemically modifying biological molecules.

Disclosure; Page 22; 162pp; English

PCR primers AAAS8474-A58541 were used to amplify open reading frames (ORFs) 8 to 41 of the BLM (Bleomycin) gene cluster. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched reacted with an apo-carrier protein and coenzyme A to produce a holocarrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazolidine, thiazoline, bithiazoline and bithiazoline-containing microbial metabolites. The BLM gene cluster may also be used to produce sugars

New protein, component B, isolated from urine - with antiinflammatory, anticoagulant and anti-tumour activities, also related nucleic acid, vectors and transformed cells.

Example 4; Page 28; 55pp; English.

The sequences given in AAQ87870-75 are primers which were used in the amplification of the component B cDNA. These primers were used in the rapid amplification of cDNA ends (RACE) and are targetted to various credions of the gene including exon 2 and the poly-A tail. The component B gene contains three exons and two introms. Exon 1 is 84 bp and contains cas bases of untranslated mRNA. It encodes 19 amino acids of the putative signal peptide and is separated from exon 2 by an intron of 410 bp. Exon 2 is 120 bp and codes for 3 amino acids of the putative signal sequence and 37 amino acids of the mature protein. It is separated from exon 3 by an intron of abbout 550 bp. Exon 3 is 326 bp and encodes the C-terminal contains a poly-A signal 14 bp upstream of the 3 processing site.

Component B is a low molecular weight protein which may be isolated from thum unine by adsorption at acid pH on kaclin, then extraction with column hydroxide. It inhibits binding of TGP-alpha to its receptor, and so has antiinflammatory, anticoagulant and/or antitumour activities. It may also be used to treat conditions associated with altered levels of TGF-alpha, eg. behavioural or hormonal disturbances and angiogenesis. See 25 mAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)

Reelin protein CR-50 epitope region, useful for diagnosis and treatment of cerebral disturbance.

Example 2; Page 7; 16pp; Japanese.

The present invention describes the mouse realin protein CR-50 epitope region, which contains the CR-50 antibody recognition site and is free from F-spondin domains and repetitive sites. Also described are: (1) an expression vector comprising a polymucleotide encoding a realin protein epitope region; (2) host cells with transfected the expression vector;

(3) polypeptides prepared by culture of the host cells; and (4) polymucleotides comprising the 351 base sequence given in ABL40165 which encodes the 117 amino acid sequence given in ABB06244; and (5) use of the polymucleotide for diagnosis and/or treatment of diseases caused by abnormal positioning of neural cells, and stimulation of association of reelin protein. The mouse reelin protein CR-50 epicope region has neuroprotective activity, and can be used in the diagnosis and treatment of cerebral disturbance due to an abnormal reelin gene and positioning of neurons. The present sequence represents a PCR primer for the mouse reelin protein CR-50 epitope region, which is used in an example from the present invention 88888888888888

New isolated nucleic acid involved in growth regulation in human colonic epithelial cells, termed CATX, for diagnosing and treating abnormal cell growth, and for use as a probe/primer for detecting tumors.

Example; Page 88; 130pp; English.

The invention relates to an isolated nucleic acid (I) involved in growth regulation in human colonic epithelial cells, termed CATX. (I) is useful as a probe-primer for detecting tumours, preferably colon cancer. The nucleic acid, encoded polypeptide and antibody are useful in diagnosis and treatment of abnormal cell growth (such as cervical cancer, mealsonmas, colorectal adenocarcinomas, Wilms' tumour, leukaemias and lymphomas), in screening assays for the treatment of abnormal cell growth, for raising antibodies, and to screen for peptide analogues and growth, for raising antibodies, and to screen for peptide analogues and printaghists. (I) is useful as a biomarker for human tumour cells, e.g., colon cancer cells, for generating probes and primers designed for identifying and/or cloning homologues in other cell types, in antisense brange of development, so that premalignant cells can be identified prior to their spreading throughout the human body. (I) allows early detection

The present invention describes a protein which is fused with a monoclonal antibody against an antigen present on cell surface and which can transfer a gene by combining with the gene and containing a human type single-stranded monoclonal antibody and a peptide which is the combining site for the gene. Also described is a complex of a monoclonal antibody-fused protein which is a complex of monoclonal antibody-fused protein and a method for the preparation of a monoclonal antibody-fused protein against a receptor present on cell surface in antibody-fused protein against a receptor present on cell surface in said monoclonal antibody against a receptor present on cell surface is used as the template to amplify a single-stranded antibody gene of a course type monoclonal antibody by PCR; (2) the framework portion of the mouse type monoclonal antibody is converted to prepare a single-stranded antibody gene of a human type monoclonal antibody to prepare a human type gene of the human type monoclonal antibody to prepare a human type single-stranded immunoporter gene; and (4) the human type single-stranded immunoporter gene; and (4) the human type single-stranded immunoporter gene; and (4) the human type single-stranded immunoporter gene; and is a microbacting the above complex of monoclonal antibody-fused protein of the human type single-stranded immunoporter. Also described is a method for introducing the above complex of monoclonal antibody-fused protein of the through a cell surface receptor. The method is used for the preparation of surface. The present sequence represents an oligonucleotide which is used in an example from the present invention

The present invention relates to human chondroitin 6-sulfotransferase (C6ST) proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in the molecular study of human extracellular matrix, for studying the biological functions of chondroitin 6-sulphate (C6S), in screening test for detecting C6ST polymorphs, for ascertaining and evaluating the role C6ST plays in atheroscierosis and for identifying potential therapeutics, i.e., inhibitors of enzyme or modulators of gene expression. The present DNA sequence is a PCR primer which is used for amplifying human C6ST gene
                                                                                                                                        Human, chondroitin 6-sulfotransferase, C6ST, chondroitin 6-sulphate, C6S, biological function; extracellular matrix; atherosclerosis; therapeutic; gene expression; enzyme; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel recombinant human chondroitin 6-sulfotransferase polynucleotide segment, useful in molecular study of human extracellular matrix, and for studying biological functions of chondroitin 6-sulfate.
                                                                                                           Human C6ST gene amplifying 5' PCR primer #3

                                                                                                                                                                                                                                                                           The patent discloses growth inhibitory genes induced by retinoids. The invention also relates to recombinant expression constructs that express a reporter gene under the transcriptional control of a promoter for a gene which is expressed by retinoid induction. The promoter does not contain a retinoic acid response elements (RARE) site. The invention that her tealates to reagents and methods for identifying compounds other than retinoids that modulate the expression of cellular genes. These compounds are useful for treating cancers such as promyelocytic leukaemia and cancer chemoprevention. The present DNA sequence is a PCR primer which is used for amplifying human secreted cell adhesion protein beta IG-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Leinamycin biosynthesis gene cluster; Lmn; open reading frame; ORF; anti-tumour antibiotic; broad spectrum antimicrobial activity; dram-negative bacteria; chemical modification; metabolite; apo-carrier protein; holo-carrier protein; tumour; polyketide; hybrid polypeptide/polyketide metabolite; Inm production; cytostatic;
                                                                                                                                                                                                  Expression construct encoding cellular genes, under control of a promoter regulated by retinoids and cells comprising the construct for identifying compounds that induce expression of the genes useful in treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9.0%; Score 12.8; DB 1; Length 18; Local Similarity 87.5%; Pred. The present invention relates to the isolation of the Streptomyces arroolivaceus leinamycin (Lnm) biosynthesis gene cluster containing 71 controlivaceus leinamycin (Lnm) biosynthesis gene cluster containing 71 can dolored frames (ORFS) (ORFS) - 35 through -1.0 ORFS inmathrough Inma, and one are adding frames (ORFS) (ORFS) - 15 through leinamout antibiotic containing a molecule and stant-incobial activity against Gram-positive and Gram-mogative bacteria, but not against fungi. The polypeptides encoded by the Lnm biosynthesis content of the bost cell is a bacterium or enkaryotic cell, including a condogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite produced by the host cell. The molecule is an endogenous metabolite or an amino acid, and the polypeptide is a peptide synthetase or amino transferame. The polypeptides encoded by the Lnm gene cluster modules and/or catalytic domains are useful for converting an apo-carriet protein to a holo-carrier or protein. Lnm shows potent antitumour acitivity in tumour models in vivo. The Lnm gene cluster modules and/or catalytic domains are useful for useful alone, or in combination with other active domains to modify various target substrates. The Lnm gene cluster is useful to upregulate condogenous modifical Lnm. Lnm, its analogue, or other polyketide, cendogenous modified Lnm. Lnm, its analogue, or other polyketide, cendogenous modified Lnm. Lnm, its analogue, or other polyketide, content an unwher of disorders depending upon the type of metabolites. Abx34311 represent PCR primers used to amplify individual ORFs of the S. atroolivaceus leinamycin blosynthesis
                                                                                                                 Novel gene cluster responsible for synthesis of leinamycin in
Streptomyces atroolivaceus useful for making various peptide and/or
polyketide, and/or hybrid polypeptide/polyketide metabolites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 18 BP; 3 A; 7 C; 6 G; 2 T; 0 U; 0 Other;

Treating kappa-type multiple myeloma in a subject by administering a K121 -like antibody not conjugated to a toxin or a cytolytic agent.

Example 8; Fig 9d; 65pp; English.

antibody heavy chain variable region. The primers were used to construct antibody heavy chain variable region. The primers were used to construct at X121-like antibody by oligonucleotide assembly using PCR. The K121-like antibody competes with K121 for binding to kappa-type myeloma cells. The K121-like antibody is used in the method of the invention. The specification describes a method for treating kappa-type multiple myeloma in a subject, comprising administering a K121-like antibody which is not conjugated to a toxin or a cytolytic agent. The method is useful for treating kappa-type multiple myeloma, autologous haematopoietic cell transplantation, killing kappa-type myeloma cells in a mixed population of cells and inducing apoptosis in kappa myeloma antigen (KMA) bearing cells

Diagnostic kit, useful for assessing a subject's tolerance of drugs, comprises reagents for determining alleles of genes encoding detoxification enzymes.

Claim 6; Page 17; 156pp; German

This invention describes a novel diagnostic kit for determining tolerance of pharmaceuticals in humans by determining allelic variability of at cleast two polymorphisms of a human enzyme involved in phase I and/or II of the detoxification mechanism in a blood, tissue or other human sample, where tolerance is determined from presence or absence of alleles. The kit comprises two pairs of oligonucleotide primers, in which each pair ampolifies, by PCR, part of a gene for a human detoxification mechanism associated enzyme. The kit may also contain two further pairs of oligonucleotides, serving as probes for detection of amplified DNA segments, especially where the probes are complementary to a single strand of one allele of the target gene. The probes are labelled with segments, especially where the probes are complementary to a single strand of one allele of the target gene. The probes are labelled with segments, especially which generate a different signal in the hybridized and non-hybridized condition. The enzymes detected include NAT2, CYP2D6, CYP1A2, CYP3A4, mEH, TPMT, MTHFR, paraoxonase, CYP2C9, CYP2C19, CYP2E1 or DPD. The kit is used to determine an individual's tolerance of a particular drug, to establish a suitable dose and/or to predict if a subject will show side-effects to a drug. The kit provides minimally invasive, safe or and reliable determination of the metabolic capacity of phase I and/or II enzymes at the molecular level. This sequence represents a probe used in the kit of the kit of the invention.

New oligonuclectides, useful for rapid detection of beer-spoilage bacteria by in situ hybridization, are specific for type, genus or species

Claim 1; SEQ ID NO 428; 88pp; German.

This invention describes novel oligonucleotides used in a method for detecting beer-spoilage bacteria in a sample. The bacteria detected include lactic acid bacteria of the genera Lactobacillus or Pediococcus, especially the species L. coryniformis, L. perolens, L. buchneri, L. plantarum, L. fructivorans, L. lindneri, L. dasei, L. brevis or P. damnosus or Gram-negative bacteria of the genera Pectinaus and Generalister, specifically P. frisingensis, P. cerevisiphilus and M. cerevisiae. The oligonucleotides of the invention provide rapid detection of spoilage bacteria (typically within 48 hours, compared with 7-12 days for conventional culture methods), can detect all relevant bacteria in parallel, can differentiate between species of the same genus, and are method of the invention.

Low oxygen culturing of central nervous system progenitor cells useful in treatment of neurodegenerative disorders.

Example 1; Page 36; 80pp; English.

A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's disease. In order to determine the differentiated phenotype messenger RNA levels can be measured using reverse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the forward PCR primer used to monitor the message level of FGF8

It was used in reverse transcription PCR to determine betyression patterns of the RGF8 gene in cultured calls. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the differentiation of each type of neurone. The different cell types can be used for tissue transplantation, to treat disorders such as stroke, brain and spinal cord neurodegenerative disorders, Huntington's disease, other neurological disorders and psychiatric disorders parkinson's disease, neurological

The invention relates to a retinoid X receptor-gamma (RXR-gamma) knockout mouse whose germ and somatic cells contain an insertion of an exogenous mouse whose germ and somatic cells contain an insertion of an exogenous content of the RXR-gamma gene (exons 3 and 4) which canced the entire DNA binding domain of RXR-gamma. The invention cell-gamma gene, and also encompasses mammalian particularly calcive RXR-gamma and also encompasses mammalian particularly murine, cell lines which are homozygous or heterozygous for a RXR-gamma gene containing an exogenous DNA insert within exoms 3 and 4. The gene containing an exogenous DNA insert within exoms 3 and 4. The capanists or antagonists using the transgenic mouse or mammalian cell ine. The genetically enginesed mouse and cell line are useful in class of receptors. The mouse and cell line allow the investigation at class of receptors. The mouse and cell line allow the investigation at coth the cellular and in vivo levels of a system that lacks one or more specific isoforms of KXR-gamma. This capability will allow the cellular confined importance of each of the RXR-gamma and its isoforms of retinoic acid-mediated gene expression and its isoforms of retinoic acid-mediated gene expression and tissue specific represent mouse RXR-gamma reverse transgenic mice of the invention. The correspondence is an RT-PCR primer for exon E5 of the mouse RXR-gamma reverse for exon E5 of the mouse RXR-gamma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New genetically engineered mice containing alterations in the gene encoding retinoid X receptor, useful for identifying agonists and antagonists of the receptors and in studying retinoic acid mediated gene
                                                                                                                             Mouse retinoid X receptor-gamma gene; RXR-gamma; exon E5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of, amongst others, cancers, autoimmune diseases, infections, inflammatory diseases, storage disorders, muscle disorders, neurodegenerative diseases and developmental defects. The present sequence is a PCR primer or probe used to isolate the sequences of the invention. All of the probes are modified at the 5' end by TBT and at the 3' end by TBMRA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell culturing; embryonic stem; BS; central nervous system; fgf8; dopaminergic; cholinergic; serotonergic; antiparkinsonian; nootropic; neuroprotective; anticonvulsant; tranquilizer; vulnerary; neuroleptic; cerebroprotective; cell therapy; gene therapy; CNS; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated polypeptide, designated NOVX, useful for treating or preventing in NOVX-associated disorders e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, allergy, asthma, Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses a method of screening mammals for autoimmune discases by identifying polymorphisms in interleukin (II)-12 pd0 gene. The methods and kits of the invention are used for screening individuals, families and populations for disease conditions or predispositions for the development of a disease condition which is characterised the development of a disease condition which is characterised are used to treat, prevent or diagnose autoimmune diseases such as IDDM (Insulin dependant diabetes mellitus). The present DNA sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; NOVX; autoimmune disease; cancer; infection; inflammatory disease; storage disorder; muscle disorder; neurodegenerative disorder; nootropic; developmental defect; neuroprotective; antiparkinsonian; hypotensive;

Studer L, Mckay RDG Lumelsky N,

Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.

Example 10; Page 41; 66pp; English.

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, ceparating embryoid bodies (EB), culturing the bodies to select for central nervous system (CMS) precured cells (PC), culturing PC in an expansion medium comprising a neurologic factor, and differentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells which are useful for treating and centrophic factor (BDNF), bFGF, glial derived growth factor (GDNF) and NT-4/5 can be introduced into a brain of a gene product such as tyrosine hydroxylase, nerve growth factor (GDNF), brain derived neurotrophic factor (BDNF), bFGF, glial derived growth cator (GDNF) and NT-4/5 can be introduced into a brain of a subject. The method is useful for culturing dopaminergic, cholinergic and servicenergic neuronal cells. The differentiated neuronal cells are useful continuing epilepsy, familial dysauchosis, severe selzure disorders including epilepsy, familial dysauchosis, severe selzure disorders including epilepsy, familial dysauchosis, severe selzure disorders continuing drug acuse capilla of regulating from aging. Assays are useful for developing drugs capable of regulating from aging. Assays are useful for dopamine or serotonin. Cell cultures comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for equences Alforders recomprise and release, particularly for serotonin and opamine, neuronal cells survival, and the electrophysicohemical properties of differentiated neuronal cells. Comprise 20-40% dopaminergic specific regulatory genes used for examining the mechanism of ES cells

New composition comprising CD34 hematopoietic cells transduced with a viral construct expressing an anti-HIV agent, useful for treating HIV, AIDS, and diseases of the blood and immune systems, e.g. Fanconi's anemia or cancer

Example 5; Page 112; 157pp; English.

The invention relates to a novel composition comprising a pharmaceutical carrier and haematopoietric cells transduced with a viral construct expressing an anti-HIV agent. A composition of the invention has virucide, cytostatic, antianaemic, anti-HIV, and cardiant activity. The compositions may have a use in gene therapy, cell therapy, and antisense therapy. The composition is useful in the manufacture of a medicament for the treating HIV. The composition can also be used in the treatment of a

```
variety of diseases in which there is a genetic aspect, such as diseases of the blood and immune systems, including haemoglobinopathies, defects of leukocyte production or function including cancers, AIDS/HIV, viral infections, lysosomal storage diseases and stem cell defects such as Fanconi's anaemia, chronic granulomatous diseases, Gaucher's disease, GGFD deficiency, and cardiovascular diseases. The present sequence represents a highly conserved RNAi target sequence from HIV-1 HXB2. (Updated on 27-OCT-2003 to standardise OS field)

Identifying agent that modulates GPR43 function, useful for treating migratine, soltzophrenia, anxiety, by measuring binding of GPR43 polypeptide to short chain fatty acid in presence and absence of candidate modulator.

Example 2; Page 80; 136pp; English.

The invention relates to identifying an agent that modulates function of d-protein coupled receptor GPRA3. The method involves measuring the binding of GPRA3 polypeptide to short chain fatty acid [II] in presence and absence of [III], or measuring signaling activity of SPRA3 contacted with [II] in presence and absence of [III], or measuring signaling activity of GPRA3 in presence of [II] and comparing the activity to activity measured in a sample in which GPRA3 is contacted with [II] in presence of [II] and comparing the activity of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating polency of GPRA3 in a call and for modulating will also of disorders such as womiting, migraine, schizophrenia, manic depression, anxiety, dementia, neurodegenerative diseases such as

Alzheimer's disease and Parkinson's diseases and dyskinesias, such as thutlington's disease. They are also useful for preventing, improving or correcting dysfunction or disease s.g., pain, cancer, anorexia, bulimia, asthma, acute heart failure, hypertension, osteoporosis, urinary tetention, angina pectoris, myocardial infarction, ulcers, allergies, stroke, and schizophrenia. The present sequence represents a GPR43 genespecific primer used in semi-quantitative RT-PCR reactions

New short interfering nucleic acid downregulates expression of the c-fos gene useful for treatment and diagnosis of diseases, e.g. cancer and inflammation.

Example 3; SEQ ID NO 40; 145pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human c-fos gene by RNA interference. The

cc stranded. They further comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or clearatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA), the siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the c-fos gene in cells, tissue explants or organisms of siNA, by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating central nervous system lesions and injuries (e.g., Alzheimer's disease, explants or alternative diseases, epilepsy, dementia or amyotrophic lateral sclerosis and polycystic kidney disease); inflammatory conditions and allergic diseases; virtal infections (including HIV infection); autoimmune diseases; virtal infections (modulance autoimmune diseases; and transplant rejection. The siNAs are also useful function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human c-fostarded double-stranded siNA, which is identical to the c-fos transcript target sequence.

```
Nucleic acid sequence determination - comprising synthesising chain extension products, which are indicative of positions of selected species of nucleotide in nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a primer for exon 3 of the HLA-C gene. This sequence can be used in the method of the invention for determining the position of at least one selected species of nuclectide, in a region of interest, in a sample. The method comprises combining the sample with a reaction mixture to synthesise chain extension products indicative of the positions of the species of nuclectide in the region of interest and evaluating the products produced, characterised in that the sample, which is combined with the reaction mixture, and contains target and non-target nucleic acid polymers in natural abundance. The method can be used to detect mutations, particularly mutations of medical significance, in samples
                                                           The murine and human tub gene (AAT48550 and AAT48551 respectively) products are wild-type, expressed in the hypothalamus. The form lacking exon 5 is produced by alternative splicing. The products participate in the control of mammalian body weight. Measuring tub expression and detection of tub gene mutation are used to diagnose body weight disorders, esp. obesity, cachexia and anorexia, or related sensory and fertility defects
                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          detection;

The region contains a prostate/colon tunour suppressor gene (PTS). The primers and amplified fragments were used to screen a YAC library of prostate cancer DNA to isolate the PSTG (AAT06880), which can be used in the diagnosis and treatment of prostate and colorectal cancers. The primers AAT06919-20 amplify a 121 bp fragment from chromosomal locus E17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding mammalian tub protein - useful for diagnosis and treatment of body wt. disorders, esp. obesity, and for screening for

The present primer was used in the mapping of a gene encoding 2 forms of a prostate/colon tumour suppressor (P/CTS). The P/CTS gene was isolated by analysis of allelic loss in patients with prostate cancer, and was putatively located to the chromosomal location 8g22-21 via microsatellite analysis and the use of sequence tagged sites (STS). Primers and probes derived from the gene can be used to screen lambda cDNA libraries for genes encoding P/CTS form 1 and 2. The P/CTS or its cDNA can be used in the diagnosis and treatment of prostate and colorectal cancers. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention.

The method is for assessing cardiovascular status in humans by the determining the sequence of at least one polymorphic site in the ACE (angiotensing enzyme), ACT (angiotensing and/or ATI (type 1 angiotensin converting enzyme), ACT (angiotensing and/or ATI (type 1 converting enzyme), ACT (angiotensing and the polymorphic pattern angiotensin II receptor) genes, and comparing the polymorphic pattern of the tin patients with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI), the prestrension, atherosciarcosis or stroke. They can also be used to predict response to treatments with ACE inhibitors, angiotensin II receptor antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular conditions in the genes are used to screen for cardiovascular agents. The nucleic acids containing to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.

The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoire of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well foldied and highly expressed. The polypeptides obtained can be used in diagnostic, prophylactic and therapeutic procedures. PCR primers AAX35946-48 were used to amplify a general in which was used in the construction of libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PG1 gene; biallelic marker; PCR primer; PG1-related biallelic marker; cancer; prostate cancer; diagnosis; therapy; prostate specific antigen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primers AXX16733-X16754 are examples of primers which can be used to PCR amplify the human "tub" gene (AAX16702) exons. The invention relates to a method for identifying compounds that modulate tub protein activity, especially its interaction with proteins containing an SN2 domain. The method can be used for identifying compounds which modulate tub protein activity for use in the treatment of mammalian body weight disorders including obesity, cachexia and anorexia
                                                                                                                                                                                                                  Mouse, wild type, tubby, identification, SH2 domain, mammal, obesity, body weight disorder, cachexia, anorexia, primer, PCR, amplification, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying compounds which modulate tub protein activity - by detecting compounds which alter the interaction of tub protein with a SH2 containing peptide, used to develop agents for treating e.g. obesity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening, functional polypeptide; ligand, non-functional, enrichment, single chain antibody, PCR primer; ss.

The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polymucleoride and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate specific antigen (BSA) diagnosis of prostate cancer relies on prostate specific antigen (BSA) and postate specific antigen (BSA) inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Human prostate cancer (HPC)2 nucleic acids, polypeptides, and antibodies, useful for treatment and diagnosis of prostate cancer.

Example 5; Page 62; 157pp; English

The present sequence is a primer used in the isolation of the human and murine prostate cancer predisposing genes HPC2 and Mm.HPC2. The human

ö version of the gene is found on chromosome 17p. Some alleles cause a predisposition to cancer, particularly prostate cancer. This gene and its protein can be used in peptide and gene therapy for cancer patients, as wall as being useful as diagnostic tools (both for cancer sufferents and those with a predisposition to the disease) and in the production of cancer drugs Gaps ö Length 19; 4; Indels G; 0 T; 0 U; 0 Other; Query Match

Disclosure; Page 52; 109pp; English.

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in Gaps ; 0 Query Match 3.0%; Score 12.6; DB 1; Length 19; Best Local Similarity 78.9%; Pred. The invention relates to a novel method of assessing the cardiovascular cratus in an individual and to newly identified polymorphisms in the eratus in an individual and to newly identified polymorphisms in the common and construction of an angiotensian. Converting enzyme (ACE), angiotensian II receptor type 1 (ATI) and type 2 (ATI), angiotensiangen (ACI), renin, aldosterone synthase, endothelin receptor type A and beta-adreneragic receptors; and 2. The method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the crospication appointable from the individual with a reference polymorphic pattern obtained from a population of individuals exhibiting a pattern obtained from a population of individual to cardiovascular disease status. The polymorphic markers are predetermined cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a treatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-adreneracic receptor antagonists (beta-conflorate and probes for detecting penetic polymorphic site may be used as the provides a basis for predicting the outcome of atreatment regimen. Tedimes of the genes comprising a polymorphic site may be used as primares and probes for detecting genetic polymorphisms or in molecular contrast arrays for high throughput soriening. The genes, and the proteins of they encode are useful in the screening of potential cardiovascular dungs a petermination of an individual soriening. The spenses of aliminate patient from the intail with a pub-population of potential can be evaluated to cardiovascular patients from collinical trials who are predicted to a particular cegimen Adverse results in an early trial can be evaluated with a sub-population of the test population, permitting correlated with a sub-population of the treatment group. Beneficial correlated with a sub-population and evers response, to a particular correlated with a sub-population and ever of sup

Novel phosphodiesterase and its gene for research on complex mechanism of intracellular information transfer.
                                                                                                                                                                                                                                                                                                            Sequences AAA09589-A009592 encode human phosphodiesterase 10 (PDE10) proteins AAB26853-B26856. Phosphodiesterase 10 and its gene are useful for research on the complex mechanism of intracellular information transfer. The invention includes a recombinant vector containing a PDE10 gene, and a cell transfermed with the vector. Sequences AAA09593-A09606 represent PCR primers used in the isolation of the PDE10 polynucleotide sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ACE, AGT and AT1 genes polymorphisms PCR primer SEQ ID NO: 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polymorphism, disease diagnosis, treatment; cancer; system; nervous system; glaucoma; PCR primer; ss.

methods of the invention

The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THE PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the

Assessing disease status in individual by determining sequence(s) at one or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment

WPI; 2000-638268/61.

These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to disgnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis.
individual's susceptibility to disease, in forensic and paternity testin and in genetic mapping. The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usefulbility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is concerned with a number of human single mucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

The present invention is concerned with a number of human single mucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single nucleotide polymorphism, SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful

The present invention describes a method for simultaneously determining the position of a nucleotide base in a target region of both strands of a denatured duplex nucleic acid polymer. The method comprises using a single set of reaction mixture that is combined with the nucleic acid polymer. The reaction mixture contains first and second oligonucleotide primers, each with different, spectroscopically-distinguishable contained in samples derived from a human patient, medically significant mutations, in samples derived from a human patient, animal, plant or microorganism, and for the determination of human contains (the proposed of the method can also be used to detect and identify microorganisms, especially pathogenic microorganisms, in a sample, and in situ sequencing pathogenic microorganisms, in a sample, and in in situ sequencing can cancino so produce sequencing fragments within a histological specimen, which are then removed from a selected location on the tissue preparation and loaded onto a gel for sequence analysis. The sequencing reaction is contoured of a disease condition is known, but the causative mutation is contour. The present sequence represents a sequencing primer for the human that C gene, which is used in an example from the present invention Example 2; Col 11; 27pp; English.

Novel promoters from Atlantic salmon for regulating expression of nucleotide constructs, as DNA vaccines for protecting salmon and other fish species against viral, bacterial infections.

Example 1; Page 7; 29pp; English.

The sequences given in AACS\$425-28 are primers which were used in the complification of the Salmon WHC class II beer and alpha promoters and introduction of the Salmon WHC class II beer and alpha promoters and introduction of the amplified sequences may be incorporated in nucleotide constructs for the purpose of regulating the expression of such constructs. For example, the salmon WHC class II beta-promoter was a nestred in a plasmid vector carrying the lac2 gene. The resulting constructs for promote transcription of the Lac2 gene. The resulting plasmid vactor carrying the had gene of the resulting plasmid vactor and plasmid vactor almoners almon presembles. The remults showed that fishes injected with the WHC class II promoter results showed that fishes injected with the WHC class II promoter results showed that fishes injected with the WHC class II promoter. Containing plasmid, showed an ELISA titer higher than the mean value +2 times the standard deviation of the control fishes. No immune response was detected using DNA-plasmid with Lac2 gene without promoters. Constructs such as these, may be used in vivo to achieve productivity enhancement in production organisms which are bony fish aquatic and constructs may also be useful for DNA vaccination of salmon and other constructs may also be useful for DNA vaccination of salmon and other fishers and may also be combined with WHC alleles for optimizing the expression and presentation of pathogenic application of pathogenic and pression and presentation of pathogenic and control of salmon are specific outsides and may also be combined with WHC alleles for coloring in salmonids. The promoters in salmon are specific and coloring in salmonids. The promoters is active. The constitutive coloring the expression and presentation of the gene of interest constitutive of promoters halps in expressing the gene of feter-acoteness and compounds responsible for restricted to cells in where expression of the gene of interest constitutively in all colors to the viral infection si

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antiposciatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, dynamous or basal cell carichmam and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal deteachment, and for treating and preventing proliferation and second as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57877 to AAH62099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a PCR primer for wild-type leuk gene from E.coli, which encodes alpha-isopropylmalate synthase (IPMS). The leuk gene was used to generate a mutant alpha-IPMS, which is de-sensitised in feedback inhibition by L-leucine. The mutant alpha-IPMS is useful for the production of L-leucine, which is useful for medical treatment, as a production of other amino acids such as Jysine. The present sequence was used to amplify the leuk gene for use in the present invention
                                                                                                                                                                                                                                                                                                                           Alpha-isopropylmalate synthase; enzyme; IPMS; leucine production; leuA; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell-cycle dependent kinase cdk4 ribozyme binding site SEQ ID NO:415.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

The present invention relates to a number of prostate-specific sequences derived from the human PS118 gene. These can be used in the detection, monitoring and treatment of prostate diseases, particularly prostate cancer. The PS118 fragments of the invention were isolated from a prostate tissue expressed sequence tag (EST) library. The present sequence is a PCR primer used to isolate a sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel PS118 polypeptide for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating, or determining predisposition of individual to diseases and conditions of prostate, e.g. prostrate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, mouse, HPC2, prostate cancer, neoplastic growth, cytostatic, si

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [1] comprising a promoter operably linked to a nucleic acid segment encoding [3]. [4] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [7] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a human prostate cancer predisposing gene coding for an HPC2 polypeptide. The DNA and protein sequences are useful as diagnostic reagents for identifying a mutant HPC2 nucleotide sequence in a suspected mutant HPC2 allele by comparing the sequence of the suspected mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also useful for detecting an alteration in HPC2, where the alteration is associated with cancer in a human. The method involves analysing an HPC2 gene or an HPC2 gene expression product from a tissue of the human. The HPC2 gene is useful as a marker for prostate cancer and can be used in gene therapy techniques to suppress neoplastic growth of recipient cells which carry the mutant HPC2 allele. The sequences represent primers used in the methods of the invention, CDNA encoding human and mouse HPC2 and
                                                                                                                                                                                                                                                                                     Novel nucleic acid sequence encoding HPC2 polypeptide, which is marker for prostate cancer, is useful in gene therapy techniques to restore HPC2 normal levels by which neoplastic growth is suppressed in recipient cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human serotonin-like G-protein coupled receptor PCR primer.

                                                                                                                                                                                                                              The present sequence is a forward primer for a novel human serotonin-like G-protein coupled receptor (5HT-like GPCR, see ABN64895). The primer was used in the RT-PCR amplification of 5HT-like GPCR, RRNA in order to determine the expression profile of the receptor. 5HT-like GPCR mRNA was highly expressed in cerebellum, postcentral gyrus, dorsal root ganglia, erythrovytes, lung chronic obstructive pulmonary disease (GOPD), oesophagus, ileum chronic inflammation, benign prostatic hypertrophy (BPH) and penis. The invention provides reagents which regulate the 5HT-like GPCR and resegents which bind to 5HT-like GPCR gene products. These reagents can play a role in preventing, ameliorating or correcting dysfunctions or diseases including COPD, a cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                      cancer, a urinary disorder, obesity, diabetes, a central nervous system (CNS) disorder, asthma or a hematological disorder (all claimed) in a subject. The reagent is especially an antisense oligonucleotide, ribozyme or antibody. Pharmaceutical compositions comprising the reagent, or an expression vector encoding 5HT-like GPCR, are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                         New G-protein coupled receptor (GPCR) polynucleotide and its encoded protein, useful for identifying modulators of GPCR activity, and in gene therapy for treating bacterial infection, cancer, acute heart failure or Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Detecting presence of target PS118 polynucleotide in test sample, useful for detecting, diagnosing, staging, monitoring, prognasticating, preventing or treating or determining predisposition to prostate disease.

WPI; 2002-187683/24.

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates numbered for discrimination are mixed from the arker of a sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell containing the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell containination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the calculate are specified from the amplified by using the above primer; (g) signals resultant cultures are amplified by using the above primer; (g) signals created efform the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed plates are specified from the detected result; and (i) the clones are precipied from the detected result; and (i) the clones are precipied for human chromosome 21q223; which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PS118; prostate; marker; prostate cancer; human; sequencing; primer; ss.

The present sequence is that of a sequencing primer designed from sequencing information of a prostate-specific PS118 consensus sequence tages ABA91561): It was used in the sequencing of PS118 expressed sequence tag-specific clones (see ABA91642-50) transcribed from human prostate tissue. PS118 polypeptides (see AAMS0809-13), polymucleotides (see aAMS0809-13), stagings) monitoring, prognosticating, preventing and treating, or determining the predisposition of an individual to, hyperplasia, prostatic intraepithelial neoplasia, prostate cancer, tumours and metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lolium perenne; perennial ryegrass; plant; cell wall; lignification; cellulase; enzyme; lignin biosynthesis; cellulose degradation; CCOAMT; caffeoyl-CoA 3-O-methyltransferase; cinnamyl alcohol dehydrogenase; CAD; caffeic acid O-methyltransferase; OMT; cinnamete-4-hydroxylase; C4H; cinnamoyl-CoA reductase; CCR; percoxidase; PER; ferulate-5-hydroxylase; F5H; CELL; phenylalanine ammonia lyase; PAL; 4-coumarate:COA ligase; 4CL; ryegrass; fescue species; molecular genetic marker; PCR primer; 88.

New nucleic acid molecule comprising a sequence of an allele of a polymorphic bovine acyl CoA-diacylglycerol transferase gene useful for testing a mammal for its predisposition for fat content of milk and for meat marbling.

Example 2; Page 27; 91pp; English.

The present invention describes a nucleic acid molecule (NA) (I) encoding to a bovine acyl CoA-diacylglycerol transferase (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling correction for low fat content of milk and to chromosome 8, and (intramuscular fat content). Human DGAT is located to chromosome 8, and content of milk and/or its and its predisposition for fat content of milk and/or its correction for meat marbling. The method comprises analysing the gene conding DGAT for nucleotide polymorphisms (e.g. single nucleotide correction for meat marbling. The method comprises analysing the gene conding DGAT for nucleotide polymorphisms are located in the coding region of the DGAT conclected polymorphisms are located in the coding region of the DGAT conclected has at the position 10433 and 10434 of the DGAT conclected has at the position 10433 and 10434 of the DGAT conclected has at the position of an amino conclected milk and low meat marbling. The nucleic acid molecule has at the position of the DGAT corresponding to position 10433 and 10434 of the DGAT corresponding to position 10433 and 10434 of the DGAT corresponding to position 10433 and 10434 of the DGAT corresponding to position 10433 and 10434 of the DGAT gene and high meat marbling. The nucleic acid molecule has at the position of regidues which correlate with a predisposition for high content of milk and high meat marbling. The prodisposition for high content of milk and high meat marbling the appreasion of the expression of the present conduct of the gene encoding DGAT. ABZ7045 to ABZ77045 and ABP96035 to high content sequences used in the exemplification of the present invention

Novel human proteins and nucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

### Example C; Page 301; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABR54276. NOVX sequences have antiatheroscelerotic, cardiant, hypotensive, dermatological anosectic, immunosuppressive, cytostatic, antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antisathmatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for trating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodises can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, actic stenosis, valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital heart defects, actic stenosis, congenital adrenal hyperplasia, prostate cancer, fertility, haemophilia, disconders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, disease, allos bronchial asthma, Crohm's disease, multiple sclerosis, and mecatoolic disorders, dyslipidaemias, and metabolic syndrome X. Alzheimer's disease, parkingon's disease, multiple sclerosis, and mematopoietic disorders, dyslipidaemias, and metabolic syndrome X. Acc62465 represent PCK primers and probes for human NOVX processent PCA 277 processent processis of conferences, which are used in examples from the present invention. ABK54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention
